

The **existing view** to the south toward the proposed El Casco Substation site, from eastbound San Timoteo Canyon Road, immediately north of the substation site. The viewpoint was selected because the gaps in the adjacent vegetation allow views into the substation site. However, while much of the landscape is natural in appearance, what is not clearly captured in this view are the five adjacent transmission lines that border the site. The linear horizontal form of the existing rail line in the immediate foreground is another prominent build feature in the landscape.
