

**Table 5**  
**Potential for Habitat at the Moorpark ILA Site to Support Sensitive Species**  
**Occurring in the Vicinity**

The San Diego desert woodrat (*Neotoma lepida intermedia*) is a federal species of concern and is particularly abundant in rock outcrops and rocky cliffs and slopes of coastal southern California from San Diego County to San Luis Obispo County. They prefer moderate to dense vegetation canopies.

*This site has no appropriate habitat for the San Diego desert woodrat.*

The Santa Ana sucker (*Catostomus santaanae*) is a federal candidate species for listing. It is endemic to south coastal streams of the Los Angeles basin. They can be found in a variety of aquatic habitats, but prefer sand-rubble-boulder bottoms with clear water and algae-covered surfaces.

*This site has no aquatic habitat for the Santa Ana sucker.*

The Plummer's mariposa lily (*Calochortus plummerae*), a federal species of concern, is a perennial herb blooming between May and July. It typically occurs on rocky and sandy sites, usually of granitic or alluvial material, within coastal scrub, chaparral, valley and foothill grassland, and lower montane coniferous forest communities.

*This site is entirely developed and lacks suitable habitat for Plummer's mariposa lily.*
