

The **existing view** to the southwest toward proposed structure location SP117 as the route approaches the Narrows along SR 78. The Narrows Substation with its complex structural form and industrial character is visible in the left side of the image. Also visible are several wood poles associated with another transmission line. This view is, from westbound SR 78, approximately 0.1 mile east of the Narrows Substation. The Narrows is a gap between the rugged angular forms of Vallecito Mountain to the south (left) and Yaqui Ridge to the north (right).
