(2) Box with inside container filled to shipping capacity with a solution which is compatible with the plastic bags, and remains liquid at 0° F. or lower shall be dropped once from a height of 4 feet onto concrete, when container and contents are at or below 0° F. Box shall be positioned so as to strike flat on the box bottom.

(3) Box with inside container filled as prescribed in paragraph (c)(1) of this section shall be capable of withstanding a vibration test by placing the container on the vibration table anchored in such a manner that all horizontal motion shall be restricted and only vertical motion allowed. The test shall be performed for one hour using an amplitude of one inch at a frequency that causes the test container to be raised from the floor of the table to such a degree that a piece of paper or flat strap or tape can be passed between the table and the container.

(d) Tests to be conducted by or for each plant assembling and filling boxes at the initial start of production and at intervals of four months thereafter. Samples last tested must be dated with date of test and must be retained until further tests are made.

§ 178.206 Specification 12C; fiberboard boxes.

§ 178.206-1 Compliance. (a) Required in all details.

§ 178.206-2 Definitions. (a) Terms such as "200-pound test" means minimum strength, Mullen or Cady test.

For explanation of abbreviations and reference marks, see last page of this tariff.

(b) "Joints" are where edges of parts of box, except recessed flanged heads, are connected together in setting up the box. Generally done by box maker.

(c) "Seams" are where edges of parts of box are visible, except joints, when box is closed.

§ 178.206-3 Classification of board. (a) Fiberboard is hereby classified as strength of completed board as in first column of the following table; weights specified in the table are the minimums authorized.

Classified strength[1] of completed board	Solid fiberboard—Minimum combined weight of component plies exclusive of adhesives (pounds per 1,000 sq. ft.)	Facings for corrugated fiberboard	
		Double-faced—Minimum combined weight of facings (pounds per 1,000 sq. ft.)	Double wall—Minimum combined weight of facings including center liner (pounds per 1,000 sq. ft.)
175	143	75	.....
200	190	84	92
275	237	138	110
350	283	190	126

[1] Mullen or Cady test (minimum).

§ 178.206-4 Solid fiberboard. (a) To be 3-ply or more; both outer plies water resistant.

§ 178.206-5 Corrugated fiberboard. (a) Both outer facings water resistant; corrugated sheets must be at least 0.009 inch thick and weight not less than 26 pounds per 1000 square feet; all parts must be securely glued together throughout all contact areas.

§ 178.206-6 Stitching staples. Stitching staples must be made in such a configuration that their holding capability as installed will not be less than that of flat sheet staples 3/32 x 0.019 inch in cross section and not less than 7/16-inch wide.

§ 178.206-7 Tape. (a) Coated with glue at least equal to No. 1¾ Peter Cooper standard. Cloth tape of strength, across wool, at least 70 units, Elmendorf test. Sisal tape of 2 sheets of No. 1 Kraft paper, total weight 80 pounds per ream (500 sheets, 24 x 36 inches); sheets to be combined with asphalt and reinforced by unspun sisal fibers completely embedded in the asphalt and extending across the tape, except as provided in § 178.206-11(d).

(b) Tape for closure of slotted containers complying with the following requirements is authorized when applied as prescribed in § 178.206-17(a)(3):

(1) Tape must be not less than 3 inches wide and shall be made of two sheets of 100 percent sulphate Kraft each not less than 30 pounds basis weight, reinforced with glass, sisal, or rayon fiber, combined with a laminant of asphalt or other material not affected by temperature extremes any more than would standard 180° to 200° softening point asphalt.

(2) Tape must be reinforced by lengthwise fibers spaced not more than an average of ½ inch apart, and by crosswise fibers spaced not less than an average of 2 per inch except that when a diamond pattern is employed for crosswise reinforcement, the spacing between the parallel sides of the diamond measured in the machine direction must be not more than 1 inch.

(3) Glass or sisal reinforced tape must have a minimum tensile strength in the machine direction of 75 pounds per inch of width and a minimum tensile strength in the cross direction of 45 pounds per inch of width; rayon reinforced tape must have a minimum tensile strength in the machine direction of 57 pounds per inch of width and a minimum tensile strength in the cross direction of 27 pounds per inch of width with elongation not exceeding 15 percent. Tensile tests on the finished product shall be made on a 3-inch width sample.

§ 178.206-8 Test. (a) Acceptable board must have prescribed strength, Mullen or Cady test, after exposure for at least 3 hours to normal atmospheric conditions (50 to 70 percent relative humidity), under test as follows:

(1) Clamp board firmly in machine and turn wheel thereof at constant speed of approximately 2 revolutions per second.

(2) Six punctures required, 3 from each side; all results but one must show prescribed strength.

(3) Board failing may be retested by making 24 punctures, 12 from each side; when all results but 4 show prescribed strength the board is acceptable.

(4) For corrugated fiberboard, double-pop tests may be disregarded.

§ 178.206-9 Types authorized. (a) To be of solid or corrugated fiberboard of the following types:

(1) Slotted box; three-piece box without recessed ends; three-piece box of solid fiberboard with recessed ends; double-slide box; triple-slide box; telescope box, with sections of equal depth, or with covers lap or bottom or both, with 3-inch overlap. (See § 178.206-14(d) for boxes with single-flap closures.)

§ 178.206-10 Forming. (a) Parts must be cut true to size, and so creased and slotted as to fit closely into position without cracking, surface breaks, separation of parts outside of crease, or undue binding.

§ 178.206-11 Joints. (a) For solid and corrugated fiberboard slotted containers: Lapped 1½" from center of scoreline except as in § 178.206-12, stitched at 2½" intervals and within 1" of each end of joint; body joint must be double-stitched (2 parallel stitches) at each end of joint over 18" long.

(b) For corrugated fiberboard slotted containers only: One butt joint taped (see § 178.206-7) is authorized, 3 inch tape required for boxes over 30 pounds authorized gross weight and 2 inch tape for others.

(c) For triple and double slide boxes: Joints of all sides must be taped (see § 178.206-7) or stitched.

(d) For corrugated fiberboard only: One butt joint taped inside and outside with strips of one thickness of sulphate paper not less than 2 inches wide extending entire length of joint and firmly glued to box. For boxes not exceeding 65 pounds gross weight, outside strip of sulphate paper to be of basis weight not less than 60 pounds testing not less than 60 pounds and inside strip of sulphate paper to be of basis weight not less than 40 pounds testing not less than 40 pounds. For boxes exceeding 65 pounds gross weight, outside and inside with strips of sulphate paper which must each be of basis weight not less than 90 pounds testing not less than 90 pounds. Basis weight of paper shown is 500 sheets, 24 x 36 inches.

(1) For glued lap joint, the sides of box forming joint must lap not less than 1¼" and be firmly glued throughout entire area of contact with a glue or adhesive which cannot be dissolved in water after the film application has dried.

§ 178.206-12 Flanged heads. (a) Must have 4 flanges, at least 1" long above fillet, on each head. Recessed flanged heads not authorized for boxes of corrugated fiberboard.

§ 178.206-13 Seams which are to be stitched. (a) Overlap, if any, required to be at least 1½" from center of scoreline except as in § 178.206-12.

§ 178.206-14 Flap closures. (a) Fill-in pieces, of the same type fiberboard as used in construction of the container, are required where it is necessary to prevent an opening between the inner flaps, unless otherwise provided by Part 173.

(b) If to be closed by adhesive, each inner flap must cover at least ⅓ of face; inner flaps must butt or have full overlap, or fill-in pieces must be used, unless otherwise provided by Part 173, except that fill-in pieces are not required when outer flaps have full overlap. Outer flaps must be reasonably close together at the center seam or have full overlap.

(c) In lieu of fill-in pieces between inner flaps which do not butt, the following is authorized when linings are not prescribed in § 178.206-16:

(1) Top and bottom pads the same dimensions as interior of container of solid or corrugated fiberboard at least 125 pound test (Mullen or Cady).

(2) Minimum combined weight of facings for corrugated fiberboard pads must be at least 52 pounds per thousand square feet.

(3) Minimum combined weight of component plies for solid fiberboard pads must be at least 114 pounds per thousand square feet, exclusive of adhesives.

(4) Complete inner box or boxes.

(d) Single-flap closures are authorized for boxes with one dimension not over 2"; each flap must be scored and form one of the small faces of the box and lap at least 5" on one of the largest faces.

§ 178.206-15 Linings (when prescribed). (a) Of 1-piece to extend around 4 faces with joint at center of 1 face and with 4 flanges, at least 1½" long, on each end (corners may be mitered) to bend over the other 2 faces; also 2 pads to cover the other 2 faces. Pads may be omitted if closing flaps afford 3 thicknesses throughout face. For boxes with 1 dimension not over 3", one of the widest flanges may be lengthened to cover entire face and lap 6" on the adjoining face and the other flanges and the pads may then be omitted.

§ 178.206-16 Authorized gross weight and parts required. (a) Authorized gross weight (when packed) and parts required as follows:

Authorized gross weight (pounds)	Strength of fiberboard (minimum) Mullen or Cady test						
	Solid board		Heads[1]	Double-faced corrugated		Double-wall corrugated	
	Box	Lining[2]		Box	Lining[2]	Box	Lining[2]
30	175	.....	200	175	.....	200	.....
40	200	.....	275	200	.....	200	.....
65[4]	275	.....	350	275 200	 175	275	.....

[1] For recessed heads when used. In other cases same as for box.

[2] As prescribed in § 178.206-15. A complete box is acceptable in place of the lining.

[3] Facings at least 138 pounds per thousand square feet or inner facing at least 42 pounds and outer facing at least 90 pounds per thousand square feet.

[4] Except as otherwise authorized by Part 173.

(b) Triple slide boxes of double-faced corrugated fiberboard of at least 175-pound test are also authorized for 65 pounds gross weight.

§ 178.206-17 Closing for shipment. (a) Slotted container, by coating with adhesive the entire contact surfaces of closing flaps and fill-in pieces where required or as prescribed in subparagraphs (1), (2), or (3) of this paragraph.

(1) By stitching with staples as prescribed by § 178.206-6 at 2½" intervals along all seams (one 5" space allowed when necessary to permit use of stitching device); or with staples made of flat wire of hardness not less than equivalent of Rockwell B90, and not less than .037 inch thick and not less than .074 inch wide, with not less than 1⅛ inch crown, may be spaced not more than 5 inches apart. Such staples may be used across center seam where outside flaps meet in lieu of on both sides of center seam but need only be used where outside flaps overlay inner flaps; or staples made of accurate wire of hardness not less than equivalent of Rockwell B90, and not less than .027 inch thick and not less than .095 inch wide, with not less than 1 inch crown, may be spaced not more than 5 inches apart. Such stitches when spaced not more than 2½ inches apart may be used across center seam where outside flaps meet in lieu of on both sides of center seam but need only be used where outside flaps overlay inner flaps.

(2) For fiberboard boxes containing not more than 1 inside metal can not exceeding 1 gallon nominal capacity, by application of 2 strips of pressure-sensitive tape not less than ½ inch in width, 1 strip to be placed approximately equal distance over the seam of abutting outer flaps, the other at a right angle to the first and spaced approximately equal distance on the closure face; strips must be of sufficient length to extend not less than 1 inch beyond score lines on side and end panels. Tape shall have a minimum tensile strength of 160 pounds per inch of width; minimum adhesion value of 18 ounces per inch of width; and minimum elongation of 12 percent at break, or having a minimum longitudinal tensile strength of not less than 240 pounds per inch of width; minimum adhesion value of 18 ounces per inch of width and a minimum elongation of 3 percent at break.

(3) For slotted containers only, reinforced tape complying with the requirements of § 178.206-7(b) is authorized for application over the center seam only. Tape must extend over the ends of box not less than 2 ½ inches.

(b) Double slide boxes or triple slide boxes, by coating with adhesive the inner sides; for single-flap closures as authorized for boxes with one dimension not over 2", the flaps must be fastened to the body with adhesive.

(c) Fiberboard boxes with covers extending over sides but not to bottom, covers resting on walls of box, or telescope boxes of equal depth section, covers extending to bottom, must be secured by one of the following methods:

(1) By not less than three metal straps, one lengthwise and others at right angles thereto.

(2) When cover extends not less than 3" over the walls of the box, by coating with adhesive the entire contact area of the cover.

(d) When metal straps are specified, boxes must be strapped with the required number, size at least ⅝" x 0.015".

§ 178.206-18 Marking. (a) On each container. Symbol in rectangle as follows:

DOT-12C***

(1) Stars to be replaced by authorized gross weight (for example, DOT-12C65, etc.).

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

(3) When metal straps are prescribed, boxes must be marked "..... (number) **METAL STRAPS REQUIRED**" just above or below the mark specified in (a)(1) of this section.

(4) Size of markings: Specification markings prescribed in paragraph (a)(1) in § 178.206-18 must be at least ½" high; other markings must be legible.

§ 178.206-19 Special box; authorized only for polyethylene, or other suitable plastic, tight-fitting inside containers having minimum wall thickness of 0.015 inch and so designed as to maintain their configuration when standing empty and open. (a) Box shall comply with this specification except that top of box shall be closed by means of slotted flaps so arranged as to provide protection for the neck of the inside container and be filled with fill-in pieces as necessary. Top may have die-cut area of suitable size to provide for easy opening. Complete package, closed as for shipment, with inside container filled to rated capacity with water, must be capable of withstanding 2 drops from a height of 4 feet onto solid concrete without leakage or serious rupture of box. Authorized gross weight not over 65 pounds. (See § 173.257(a)(6).)

---

§ 178.207 Specification 12D; fiberboard boxes.

§ 178.207-1 Compliance. (a) Required in all details.

§ 178.207-2 Definitions. (a) Terms such as "200-pound test" mean minimum strength, Mullen or Cady test.

(b) "Joints" are where edges of parts of box are connected together in setting up the box. Generally done by box maker.

(c) "Seams" are where edges of parts of the box are visible, except joints, when box is closed.

§ 178.207-3 Classification of board. (a) Fiberboard is hereby classified by strength of completed board as in first column of the following table; weights specified in the table are the minimums authorized.

Classified strength[1] of completed board	Facings for double-wall corrugated fiberboard—Minimum combined weight of facings including center liner (pounds per 1,000 sq ft)
275	110
350	126

[1] Mullen or Cady test (minimum).

§ 178.207-4 Corrugated fiberboard. (a) Both outer facings water resistant; corrugated sheets at least 0.009" thick and weigh not less than 26 pounds per 1000 square feet; all parts securely glued together throughout all contact areas.

§ 178.207-5 Stitching staples. Stitching staples must be made in such a configuration that their holding capability as installed will not be less than that of flat steel staples ⅜₂ × 0.019 inch in cross section and not less than 7/16 inch wide.

§ 178.207-6 Tape. (a) Coated with glue at least equal to No. 1¾ Peter Cooper standard. Cloth tape of strength, across the wool, at least 70 units, Elmendorf test. Sisal tape of 2 sheets of No. 1 Kraft paper, total weight 80 pounds per ream (500 sheets, 24" × 36"); sheets to be combined with asphalt and reinforced by unspun sisal fibers completely embedded in the asphalt and extending across the tape, except as provided in § 178.207-10 (d).

(b) Tape for closure of slotted containers complying with the following requirements is authorized when applied as prescribed in § 178.207-17 (a)(3):

(1) Tape must be not less than 3 inches wide and shall be made of two sheets of 100 percent sulfate Kraft each not less than 30 pounds basis weight, reinforced with glass, sisal, or rayon fiber, combined with a laminant of asphalt or other material not affected by temperature extremes any more than would standard 180° to 200° softening point asphalt.

(2) Tape must be reinforced by lengthwise fibers spaced not more than an average of ½ inch apart, and by crosswise fibers spaced not less than an average of 2 per inch except that when a diamond pattern is employed for crosswise reinforcement, the spacing between the parallel sides of the diamond measured in the machine direction must be not more than 1 inch.

(3) Glass or sisal reinforced tape must have a minimum tensile strength in the machine direction of 75 pounds per inch of width and a minimum tensile strength in the cross direction of 45 pounds per inch of width; rayon reinforced tape must have a minimum tensile strength in the machine direction of 57 pounds per inch of width and a minimum tensile strength in the cross direction of 27 pounds per inch of width with elongation not exceeding 15 percent. Tensile tests on the finished product shall be made on a 3-inch width sample.

§ 178.207-7 Test. (a) Acceptable board must have prescribed strength, Mullen or Cady test, after exposure for at least 3 hours to normal atmospheric conditions (50 to 70 percent relative humidity), under test as follows:

(1) Clamp board firmly in machine and turn wheel thereof at constant speed of approximately 2 revolutions per second.

(2) Six punctures required, 3 from each side; all results but one must show prescribed strength.

(3) Board failing may be retested by making 24 punctures, 12 from each side, when all results but 4 show prescribed strength the board is acceptable.

(4) Double-pop tests may be disregarded.

§ 178.207-8 Types authorized. (a) To be of double-wall corrugated fiberboard of the following types:

(1) Slotted box; three piece box without recessed ends; double-slide box; triple-slide box; telescope box, with sections of equal depth, or with covers, top or bottom or both, with 3 inch overlap.

§ 178.207-9 Forming. (a) Parts must be cut true to size and so creased and slotted as to fit closely into position without cracking, surface breaks, separation of parts outside of crease, or undue binding.

§ 178.207-10 Joints. (a) For slotted containers: Lapped 1½" from center of scoreline except as in § 178.207-11; stitched at 2½" intervals and within 1" of each end of joint; body joint must be double-stitched (2 parallel stitches) at each end of joint over 18" long.

(b) For slotted containers only: One butt joint taped (see § 178.207-6) is authorized; 3 inch tape required.

(c) For triple and double side boxes: Joints of all sides must be taped (see § 178.207-6) or stitched.

(d) One butt joint taped inside and outside with strips of one thickness of sulphate paper not less than 2 inches wide extending entire length of joint and firmly glued to box. For boxes not exceeding 65 pounds gross weight, outside strip of sulphate paper to be of basis weight not less than 60 pounds testing not less than 60 pounds and inside strip of sulphate paper to be of basis weight not less than 40 pounds testing not less than 40 pounds. For boxes exceeding 65 pounds gross weight, outside and inside with strips of sulphate paper which must each be of basis weight not less than 90 pounds testing not less than 90 pounds. Basis weight of paper shown is for 500 sheets, 24 × 36 inches.

(1) For glued lap joint, the sides of box forming joint must lap not less than 1¼" and be firmly glued throughout entire area of contact with a glue or adhesive which cannot be dissolved in water after the film application has dried.

§ 178.207-11 Flanged heads. (a) Must have 4 flanges, at least 1" long above fillet, on each head. Recessed flanged heads not authorized.

§ 178.207-12 Seams which are to be stitched. (a) Overlap, if any, required to be at least 1½" from center of scoreline except as in § 178.207-11.

§ 178.207-13 Flap closures. (a) Fill-in pieces, of the same type fiberboard as used in construction of the container, are required where it is necessary to prevent an opening between the inner flaps.

(b) If to be closed by adhesive, each inner flap must cover at least ⅓ of face; inner flaps must butt or have full over-lap, or fill-in pieces must be used, except that fill-in pieces are not required when outer flaps have full overlap. Outer flaps must butt or have full overlap.

§ 178.207-14 Linings (when prescribed). (a) Of 1 piece to extend around 4 faces with joint at center of 1 face and with 4 flanges, at least 1½" long, on each end (corners may be mitered) to bend over the other 2 faces; also 2 pads to cover the other 2 faces. Pads may be omitted if closing flaps afford 3 thicknesses throughout face. For boxes with 1 dimension not over 3", one of the widest flanges may be lengthened to cover entire face and lap 6" on the adjoining face and the other flanges and the pads may then be omitted.

§ 178.207-15 Authorized gross weight and parts required. (a) Authorized gross weight (when packed) and parts required as follows:

(1) For authorized gross weight not over 25 pounds, box must be constructed of at least 275-pound test double-wall corrugated fiberboard with liners and top and bottom pads, or a complete inner box, of same material.

(2) For authorized gross weight over 25 pounds but not exceeding 75 pounds, inside containers must be packed in boxes of at least 275-pound test double-wall corrugated fiberboard and these packages packed in an outside box of at least 350-pound test double-wall corrugated fiberboard.

§ 178.207-16 Test for completed package. (a) The completed package closed as for shipment must be capable of withstanding a drop of 4 feet to solid concrete without breakage of the inside containers.

§ 178.207-17 Closing for shipment. (a) Slotted container, by coating with adhesive the entire contact surfaces of closing flaps and fill-in pieces, or as prescribed in subparagraphs (1), (2), or (3) of this paragraph.

(1) By stitching at 2½" intervals along all seams (one 5" space allowed when necessary to permit use of stitching device).

(2) For fiberboard boxes containing not more than 1 inside metal can not exceeding 1 gallon nominal capacity, by application of 2 strips of pressure-sensitive tape not less than ½ inch in width, 1 strip to be placed approximately equal distance over the seam of abutting outer flaps, the other at a right angle to the first and spaced approximately equal distance on the closure face; strips must be of sufficient length to extend not less than 1 inch beyond score lines on side and end panels. Tape shall have a minimum tensile strength of 160 pounds per inch of width; minimum adhesion value of 18 ounces per inch of width; and minimum elongation of 12 percent at break, or having a minimum longitudinal tensile strength of not less than 240 pounds per inch of width; minimum adhesion value of 18 ounces per inch of width and a minimum elongation of 3 percent at break.

(3) For slotted containers only, reinforced tape complying with the requirements of § 178.207-6(b) is authorized for application over the center seam only. Tape must extend over the ends of box not less than 2 ½ inches.

(b) Double side boxes or triple side boxes, by coating with adhesive the inner sides; for single-flap closures as authorized for boxes with one dimension not over 2", the flaps must be fastened to the body with adhesive.

(c) Fiberboard boxes with covers extending over sides but not to bottom, covers resting on walls of box, or telescope boxes of equal depth section, covers extending to bottom, must be secured by one of the following methods:

(1) By not less than three metal straps, one lengthwise and others at right angles thereto.

(2) When cover extends not less than 3" over the walls of the box, by coating with adhesive the entire contact area of the cover.

(d) When metal straps are specified, boxes must be strapped with the required number; size at least ½" × 0.015".

§ 178.207-18 Marking. (a) On each container. Symbol in rectangle as follows:

DOT-12D***

(1) Stars to be replaced by authorized gross weight (for example, DOT-12D65, etc.).

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

(3) When metal straps are prescribed, boxes must be marked "..... (number) METAL STRAPS REQUIRED" just above or below the mark specified in paragraph (a)(1) of this section.

(4) Size of markings: Specification markings prescribed in paragraph (a)(1) in § 178.207-18 must be at least ½" high; other markings must be legible.

---

§ 178.208 Specification 12E; fiberboard boxes.

§ 178.208-1 Compliance. (a) Required in all details.

§ 178.208-2 Definitions. (a) Terms such as "200-pound test" mean minimum strength, Mullen or Cady test.

(b) "Joints" are where edges of parts of box, except recessed flanged heads, are connected together in setting up the box. Generally done by box maker.

(c) "Seams" are where edges of parts of box are visible, except joints, when box is closed.

§ 178.208-3 Corrugated fiberboard. (a) Both outer facings water resistant; corrugated sheets must be at least 0.009 inch thick and weigh not less than 26 pounds per 1000 square feet; all parts must be securely glued together throughout all contact areas.

§ 178.208-4 Tape. (a) Coated with glue at least equal to No. 1¼ Peter Cooper standard. Cloth tape of strength, across woof, at least 70 units, Eimendorf test. Sisal tape of 2 sheets of No. 1 Kraft paper, total weight 80 pounds per ream (500 sheets, 24 × 36 inches); sheets to be combined with asphalt and reinforced by unspun sisal fibers completely embedded in the asphalt and extending across the tape.

§ 178.208-5 Test. (a) Acceptable board must have prescribed strength, Mullen or Cady test, after exposure for at least 3 hours to normal atmospheric conditions (50 to 70 percent relative humidity), under test as follows:

(1) Clamp board firmly in machine and turn wheel thereof at constant speed of approximately 2 revolutions per second.

(2) Six punctures required, 3 from each side; all results but one must show prescribed strength.

(3) Board failing may be retested by making 24 punctures, 12 from each side; when all results but 4 show prescribed strength the board is acceptable.

(4) Double-pop tests may be disregarded.

§ 178.208-6 Type authorized. (a) Corrugated fiberboard with one-piece body with separate flanged heads. Box is authorized only for 1 or 2 rectangular metal inside containers of not over 5 gallons capacity each.

§ 178.208-7 Forming. (a) Parts must be cut true to size and so creased and slotted as to fit closely into position without cracking, surface breaks, separation of parts outside of crease, or undue binding.

§ 178.208-8 Joints. (a) Body. Each end of body must have four flanges, creased to bend over outside of body, at least 2½" long beyond crease.

(b) Butt joint. One butt joint taped is authorized; 3-inch tape required.

§ 178.208–9 Flanged heads. (a) Each head must have four flanges, one on each edge, creased to bend over outside body of the box and then under the body flanges, of length at least 5 inches exclusive of creases.

§ 178.208–10 Authorized gross weight (when packed) and parts required. (a) Board for outside container must be corrugated fiberboard at least 400–pound test, minimum combined weight of component plies, exclusive of adhesives, 180 pounds per 1000 square feet; body must be double-wall board; heads may be double-faced board. Authorized gross weight 110 pounds.

§ 178.208–11 Closing for shipment. (a) Boxes must be closed by applying heads with head-flanges tucked under body-flanges and then fastening each head in place with a flat steel strap, at least ⅝" x 0.015", extending around the 4 sides of the body and securely sealed.

§ 178.208–12 Marking. (a) Each box must be marked as follows:

(1) DOT–12E110.

(i) This marking shall be enclosed by a rectangle.

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

(3) When metal straps are prescribed, boxes must be marked "..... (number) Metal Straps Required" just above or below the mark specified in paragraph (a)(1) of this section.

(4) Size of markings: Specification markings specified in paragraph (a)(1) of this section must be at least ½ inch high. All markings must be legible.

---

§ 178.209 Specification 12H; fiberboard boxes.

§ 178.209–1 Compliance. (a) Required in all details.

§ 178.209–2 Definitions. (a) Terms such as "200–pound test" mean minimum strength, Mullen or Cady test.

(b) "Joints" are where edges of parts of box are connected together in setting up the box. Generally done by box maker.

(c) "Seams" are where edges of parts of box are visible, except joints, when box is closed.

§ 178.209–3 Classification of board. (a) Fiberboard is hereby classified by strength[1] of completed board as in first column of the following table; weights specified in the table are the minimum authorized.

Classified strength[1] of completed board	Facings for corrugated fiberboard	
	Double-faced—Minimum combined weight of facings (pounds for 1,000 sq. ft.)	Double-wall—Minimum combined weight of facings including center liner (pounds per 1,000 sq. ft.)
275	138	110
325	138	110
350	180	126
375	180	180
400	180	180
450	180	180

[1] Mullen or Cady test (minimum).

§ 178.209–4 Corrugated fiberboard. (a) Both outer facings water resistant; corrugated sheets must be at least 0.009 inch thick and weight not less than 26 pounds per 1000 square feet; all parts must be securely glued together throughout all contact areas.

§ 178.209–5 Stitching staples. Stitching staples must be made in such a configuration that their holding capability as installed will not be less than that of flat steel staples 3/32 x 0.019 inch in cross section and not less than 7/16 inch wide. Materials used must be at least equivalent to copper coated steel in nonsparking quality.

§ 178.209–6 Tape. (a) Used for manufacturers' joints must be coated with glue at least equal to No. 1¾ Peter Cooper standard. Cloth tape of strength, across the wool, at least 70 units, Elmendorf test. Sisal tape of 2 sheets of No. 1 Kraft paper, total weight 80 pounds per ream (500 sheets, 24" x 36"); sheets to be combined with asphalt and reinforced by unspun sisal fibers completely embedded in the asphalt and extending across the tape.

§ 178.209–7 Test. (a) Acceptable board must have prescribed strength, Mullen or Cady test, after exposure for at least 3 hours to normal atmospheric conditions (50 to 70 percent relative humidity), under test as follows:

(1) Clamp board firmly in machine and turn wheel thereof at constant speed of approximately 2 revolutions per second.

(2) Six punctures required, 3 from each side; all results but one must show prescribed strength.

(3) Board failing may be retested by making 24 punctures, 12 from each side; when all results but 4 show prescribed strength, the board is acceptable.

(4) For corrugated fiberboard, double-pop tests may be disregarded.

§ 178.209–8 Type authorized. (a) Shall be corrugated fiberboard, telescoping type, 1–piece, 2–piece or 3–piece construction without recessed heads, as follows:

(1) Box to consist of top and bottom sections divided equally or unequally and inner lining tube. The lining tube must be staple stitched to the lower section of the box to give in effect a 2–piece box. (See § 178.209–11.)

(2) Box is to consist of full depth top and bottom sections completely telescoping. No inner lining tube is required. Four variations are authorized, the first is with the bottom slotted on the ends and the cover slotted on the sides; the second, with both the cover and bottom slotted on the sides; the third, with the bottom slotted on the sides and the cover slotted on the ends; and the fourth, with the sides and ends (both covers and bottom) not slotted, manufacturer's joint a side lap glued or stapled to end, closing flaps to form top and bottom of box with side closing flaps cut and overlapping.

Note 1: Hand-holes oval in shape, not more than 1 inch in width by 3 inches in length, and horizontal with top score line, are authorized in the ends of the top section of the boxes.

(3) Box to consist of 1–piece, 2–piece or 3–piece, without recessed heads, fitted with lining tube as prescribed in § 178.209–11, except that lining tube is not required for boxes used for shipment of electric blasting caps packed in accordance with § 173.66(g)(1). When outer flaps butt, inner flaps must also butt, except 1–piece with tube or 2–piece fully telescoping ¼ slotted style may have outer flaps that overlap a minimum of 2 inches to and including full overlap, and inner flaps may be of same length as outer flaps.

(4) Three–piece box without recessed ends. Outer flap may be full lap style with a 3–inch or longer tuck. With the full lap style, the inner end flaps must have a minimum length of 4 inches with or without hand holes.

§ 178.209–9 Forming. (a) Parts must be cut true to size and so creased and slotted as to fit closely into position without cracking, surface breaks, separation of parts outside of crease, or undue binding.

§ 178.209–10 Joints. (a) Lapped 1¼" and stitched at 2½" intervals and within 1" of each end of joint; except for full depth telescope style boxes, body joints must be double-stitched (two parallel rows of stitches).

(b) For glued lap joint, the sides of box forming joint must lap not less than 1¼" and be firmly glued throughout entire area of contact with a glue or adhesive which cannot be dissolved in water after the film application has dried.

(c) For lining tubes only, one butt joint taped (see § 178.209–6) tape not less than 3" wide is authorized.

§ 178.209–11 Authorized gross weight and parts required. (a) Box shall be corrugated fiberboard at least 275 pound test. Tubes, when required, shall be of solid fiberboard at least 200–pound test, or of corrugated fiberboard of at least 275–pound test, with adjoining edges stitched, taped, or glued.

(b) Authorized gross weight is 65 pounds.

§ 178.209–12 Closing for shipment. (a) By any method capable of withstanding tests prescribed by § 178.209–16 without failure.

§ 178.209–13 Marking. (a) On each container. Symbol in rectangle as follows:

DOT–12H**

(1) Stars to be replaced by authorized gross weight (for example DOT–12H65).

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

(3) Size of markings: Specification markings prescribed in paragraph (a)(1) in § 178.209–13 must be at least ½" high; other markings must be legible.

§ 178.209–14 Special Tests. (a) By whom and when. By or for each plant making the boxes, at beginning of manufacture and at six-month intervals thereafter, on the largest size by weight. Smaller sizes need not be tested if they have the same or equivalent construction.

§ 178.209–15 Material. (a) Box material must comply with requirements of §§ 178.209–3, 178.209–4, 178.209–7, 178.209–11, and the following:

(b) Box material must have test strength and moisture content not over 30 percent as follows:

(1) Box material must test at least 200 pounds per square inch immediately after exposure for 3 days to 90 percent relative humidity at not less than 70° nor more than 75° F.

(2) Box material must test at least 100 pounds per square inch immediately after it has been in contact with water for 3 hours under 3" head at not less than 70° nor more than 75° F.

Note: The test shall be conducted on a sample no greater than 6 inches in diameter when exposed to water. The sample shall be rigidly fastened to a water column device so constructed as to provide at least a 3 inch head of water on the outer surface of the fiberboard sample. The water column device must be suspended in such manner that free circulation of air on the inner surface of fiberboard sample which is not exposed to water is permitted. After contact with water for 3 hours under conditions specified, the water column device shall be emptied, the sample blotted, and immediately subjected to Mullen or Cady test. (A 6 inch diameter pipe having a welded flange to which the sample is secured by a bolted ring flange is acceptable).

§ 178.209-16 Completed container. (a) Samples must pass the following immediately after exposure for 2 weeks to 90 percent relative humidity at not less than 70° nor more than 75° F; loaded containers shall contain dummy contents of shape and weight of the expected contents, and shall be closed in the same manner as for shipment.

(1) Three loaded samples to be tested. Each must withstand 200 drops in standard 7-foot revolving test drum with pointed hazard in place, without spilling any contents.

(2) Three loaded samples to be tested. Each must withstand end to end pressure of at least 500 pounds without deflection of over 1½".

(3) Three empty samples to be tested. Each must withstand top to bottom pressure of at least 500 pounds without deflection of over ½ inch.

(b) As an alternate to the drum test specified in paragraph (a), 3 loaded samples must pass the drop test specified below:

(1) Box shall be dropped from height of 2 feet.

(2) Identification of face, edge, and corners. Facing one end (with the manufacturer's joint on the observer's right), the top of the box is designated as 1, the right side as 2, the bottom as 3, and the left side as 4. The near end is designated as 5 and the far end as 6. The edges are identified by the number of the two faces which make that edge, as for example, 1–2 identifies the edge where the top and right side meet and 2–5 the edge having the manufacturer's joint. The corners are identified by the number of the three faces which meet to form that corner, as for example, 1–2–5 identifies the corner where the top, the right side, and the near end meet.

(c) Drop sequence as follows:

(1) A corner drop on 1–2–5.

(2) An edge drop on the shortest edge radiating from that corner (usually 2–5).

(3) An edge drop on the next shortest edge radiating from that corner (usually 1–5).

(4) An edge drop on the longest edge radiating from that corner (usually 1–2).

(5) A flatwise drop on one of the smallest faces (usually end 5 or 6).

(6) A flatwise drop on the opposite smallest face.

(7) A flatwise drop on one of the medium faces (usually side 2 or 4).

(8) A flatwise drop on the opposite medium face.

(9) A flatwise drop on one of the largest faces (usually top 1 or bottom 3).

(10) A flatwise drop on the opposite large face.

This completes one cycle of ten drops. Commence the next cycle with a drop on the corner diagonally opposite through the box to the corner on which the first drop was made, on corner 3–4–6. Commence the third cycle of ten drops with corner 1–4–5. Each loaded container must withstand 3 cycles without spilling or sifting of contents.

§ 178.210 Specification 12A; fiberboard boxes. Nonreusable containers.

§ 178.210-1 Compliance. (a) Required in all details.

§ 178.210-2 Definitions. (a) Terms such as "200-pound test" mean minimum strength, Mullen or Cady test.

(b) "Joints" are where edges of parts of box, except recessed flanged heads, are connected together in setting up the box. Generally done by box maker.

§ 178.210-3 Classification of board. (a) Fiberboard is hereby classified by strength[1] of completed board as in first column of the following table; weights specified in the table are the minimums authorized.

Classified strength[1] of completed board	Facings for corrugated fiberboard	
	Double-faced—Minimum combined weight of facings (pounds for 1,000 sq. ft.)	Double-wall—Minimum combined weight of facings including center liner (pounds per 1,000 sq. ft.)
200	84	92
275	138	110

[1] Mullen or Cady test (minimum).

§ 178.210-4 Corrugated fiberboard. (a) Both outer facings water resistant, corrugated sheets must be at least 0.009 inch thick and weight not less than 26 pounds per 1,000 square feet; all parts must be securely glued together throughout all contact areas.

§ 178.210-5 Tests. (a) Acceptable board must have prescribed strength, Mullen or Cady test, after exposure for at least 3 hours to normal atmospheric conditions (40 to 70 percent relative humidity), under test as follows:

(1) Clamp board firmly in machine and turn wheel thereof at constant speed of approximately 2 revolutions per second.

(2) Six punctures required, 3 from each side; all results but one must show prescribed strength.

(3) Board failing may be retested by making 24 punctures, 12 from each side, when all results but 4 show prescribed strength the board is acceptable.

(4) Double-pop tests may be disregarded.

§ 178.210-6 Boxes authorized. (a) Corrugated fiberboard boxes having gross weight not over 80 pounds of the following strengths are authorized:

Gross weight not over (pounds)	Corrugated fiberboard strength (Mullen or Cady test) minimum	
	Double-faced	Double wall
20	200	200
50	275	200
80		275

§ 178.210-7 Forming. (a) Parts must be cut true to size and so creased and slotted as to fit closely into position without cracking, surface breaks, separation of parts outside of crease, or undue binding.

§ 178.210-8 Joints. (a) For slotted containers: Lapped 1½" from center of scoreline except as in § 178.210-8(b)(2); stitched at 2-½" intervals and within 1" of each end of joint; body joint must be double-stitched (2 parallel stitches) at each end of joint over 18" long.

(b) Joints as provided for by the following are authorized provided resulting joint is capable of withstanding the tests prescribed by § 178.210-10:

(1) For slotted containers only; one butt joint, taped, is authorized.

(2) For glued lap joint, the sides of box forming joint must lap not less than 1½ inches and be firmly glued throughout entire area of contact with a glue or adhesive which cannot be dissolved in water after the film application has dried.

(3) For triple and double side boxes; joints of all sides must be taped or stitched.

§ 178.210-9 Inside cushioning. (a) Sufficient inside cushioning shall be required for protection of inside containers so that completed packages as offered for shipment shall be capable of withstanding test prescribed by § 178.210-10.

§ 178.210-10 Test for completed package. (a) A minimum of 4 boxes with inside containers filled with water, and box closed as for shipment, shall be capable of withstanding the following drop tests from the prescribed heights onto solid concrete without leakage from or breakage of any inside container or rupture of the outside fiberboard box; each box shall be subjected to not more than one of the series of tests:

(1) Box No. 1. Flat drop on bottom from height of 4 feet.

(2) Box No. 2. Flat drop on side from height of 4 feet.

(3) Box No. 3. Flat drop on end from height of 4 feet.

(4) Box No. 4. Flat drop on top from height of 2 feet.

(b) Tests prescribed by paragraph (a) of this section must be conducted prior to initial use of the package and shall be repeated on the change of any components of the package.

§ 178.210-11 Closing for shipment. (a) By any method capable of withstanding tests prescribed by § 178.210-10.

§ 178.210-12 Marking. (a) On each container. Symbol in rectangle as follows:

DOT-12A**

(1) Stars to be replaced by authorized gross weight (for example, DOT-12A75). The letters NRC, located just above or below that DOT mark, to indicate a nonreuseable container.

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below those marks. Symbol, if used, must be registered with the Director, OHMT.

(3) Size of markings: Specification markings prescribed in paragraph (a)(1) in § 178.210-12 must be at least ½" high; other markings must be legible.

§ 178.211 Specification 12P; fiberboard boxes.

Nonreusable containers for inside plastic containers greater than 1-gallon capacity, as prescribed in Part 173 of this subchapter.

§ 178.211-1 Material requirements. (a) Boxes shall be of corrugated fiberboard, except as otherwise authorized in this specification, having both outer facings water resistant; corrugating medium shall be at least 0.009 inch thick and weigh not less than 26 pounds per 1,000 square feet; all parts shall be securely glued together throughout all contact areas.

(b) Solid fiberboard is authorized when of strength equal to corrugated fiberboard and in conformance with paragraph (c) of this section.

(c) Fiberboard required and tests as follows:

(1) Fiberboard is hereby classified by strength[1] of completed board as in first column of the following table; weights specified in the table are the minimums authorized.

Classified strength of completed board[1]	Solid fiberboard—Minimum combined weight of component plies exclusive of adhesives (pounds per 1,000 sq. ft.)	Single-wall—Minimum combined weight of facings (pounds per 1,000 sq. ft.)	Double-wall—Minimum combined weight of facings including center facings (pounds per 1,000 sq. ft.)
175	149	75	.....
200	190	84	92
275	237	138	110
325	237	138	110
350	283	180	126
375	283	180	180
400	283	180	180
450	283	180	180
500	330	.....	222

[1] Mullen or Cady Test (minimum).

(2) Tests of acceptable completed board must have prescribed strength, Mullen or Cady test, after exposure for at least 3 hours to normal atmospheric conditions (50 to 70 percent relative humidity) under test, as follows:

(i) Clamp board firmly in machine and turn wheel at constant speed of approximately 2 revolutions per second.

(ii) Six bursts required, 3 from each side; all results but one must show prescribed strength.

(iii) Board failing may be retested by making 24 bursts, 12 from each side; when all results but 4 show prescribed strength the board is acceptable.

(iv) For corrugated fiberboard, double-pop tests may be disregarded.

§ 178.211-2 Construction requirements. (a) Corrugated or solid fiberboard boxes of any type capable of withstanding tests prescribed by § 178.211-5 authorized when constructed in accordance with requirements of this section.

(b) Corrugated or solid fiberboard boxes in accordance with the following table are authorized.

Gross weight not over (pounds)	Strength of fiberboard (minimum) Mullen or Cady Test		
	Solid board	Single-wall corrugated	Double-wall corrugated
20	200	200	200
60	350	350	275
80	500	450	350

(c) All parts must be cut true to size and so creased and slotted as to fit closely into position without cracking, surface breaks, separation of parts outside of crease, or undue binding. Box must provide snug fit for inside plastic container.

(d) Joints (manufacturer's). The joint is defined as that part of the box where the ends of the sheet are joined together by taping, stitching or glueing.

(1) For glued or stitched lap joint, the sides of box forming joint must lap not less than 1¼ inches. Glued joints must be firmly glued throughout entire area of contact with a glue or adhesive which cannot be dissolved in water after film application has dried.

(2) Butt-joints, taped, are authorized providing resulting joints are capable of withstanding tests prescribed by § 178.211-5.

§ 178.211-3 Design limitations. (a) Design limitations are as follows:

(1) Permitted when perforated or die-cut areas remain intact following tests prescribed for box by § 178.211-5.

(i) Outer closing flaps may have perforated areas of no greater size than is necessary to provide access to closure of plastic container; inner flaps may have die-cut areas of similar type.

(ii) Die-cut holes in outer and inner closing flaps when closure for plastic container is attached to a metal plate inserted between the inner and outer flaps or when closure area is protected by means of a plug-in or screw cap or similar device. The diameter of these holes shall be less than the diameter of the metal plate.

(iii) Inside facing of fiberboard closure flaps may be cut or perforated for opening. A tear strip may be incorporated in the body wall of fiberboard boxes provided it is above the shoulder area of the plastic container and this may be accompanied by a nominal thumb-notch in the manufacturer's joint or in a side panel of the box.

(iv) Handholes, by perforation or other means, in any part of the box providing the face having the handhole is backed up by a fiberboard sheet of equal strength of box in full height and width of that face or that handholes are above the neck area of the plastic container. No more than one handhole in any face nor more than two per box.

(v) Other perforated or die cut areas of a size and location may be used when approved by the Director, OHMT.

(2) Not permitted.

(i) Stitched manufacturer's joint or stitched closures when any such stitch (staple) is in direct contact with the inside plastic container.

§ 178.211-4 Closure. (a) Closure of any type is authorized provided representative boxes are capable of withstanding tests prescribed by § 178.211-5.

§ 178.211-5 Tests. (a) Representative samples of the completed composite container assembled, filled and closed as for use must be capable of withstanding tests prescribed in the specification for the inside plastic container without rupture of the fiber board boxes that produces a condition of the box that could result in potential damage to the inside container.

§ 178.211-6 Marking. (a) On each container. Symbol in rectangle as follows:

DOT-12P**

(1) Stars to be replaced by authorized gross weight for which box was constructed (for example, DOT-12P80). The letters NRC, located just above or below the DOT mark, to indicate a nonreusable container.

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below those marks. Symbol, if used, must be registered with the Director, OHMT.

(3) Size of markings: Specification markings as prescribed in paragraph (a)(1) of this section must be at least ½ inch high; other markings must be legible.

---

§ 178.212 Specification 12R; paper-faced expanded polystyrene board boxes.

Nonreusable containers.

§ 178.212-1 Material requirements; (a) The board shall consist of completely fused closed cell expanded polystyrene with tightly adhered natural kraft paper facings for which detailed requirements are as follows:

(1) Basis weight of each facing, minimum, 42 pounds per 1,000 square feet. (Basis weight of combined facings, minimum, 84 pounds per 1,000 square feet.)

(2) Basis weight of board, minimum, 123 pounds per 1,000 square feet.

(3) Thickness of board, minimum, 0.21 inch.

(4) Moisture absorption, maximum, 25 grams weight gain per square foot with sample completely immersed in water. For one hour sample to be preconditioned to a constant weight at least 73° F. and 50 percent relative humidity prior to immersion.

(5) Adhesion of facings; no delamination after 24 hours with sample completely immersed in water. Sample shall be not less than one square foot.

§ 178.212-2 Forming. (a) Parts must be cut true to size and so creased and slotted as to fit closely in position without cracking, surface breaks, separation of parts outside of crease, or undue binding.

§ 178.212-3 Joints. (a) Definition. The seam where the two edges of the box blank are joined by the box manufacturer.

(b) The joints shall be made by precrushing the lap area of the board to a minimum combined thickness of 0.28 inch, and then securing by either stitching or gluing as follows:

(1) By lapping 1½ inches from center of score line and stitching at 2½ inch intervals and within 1 inch of each end joint; body joint over 18 inches long must be double stitched (2 parallel stitches) at each end of joint.

(2) By lapping 1½ inches from center of score line and firm gluing throughout entire area of contact with an adhesive which cannot be dissolved in water after the adhesive applied has dried.

§ 178.212-4 Inside cushioning. (a) Sufficient inside cushioning shall be required for protection of inside containers so that com-

pleted packages as offered for shipment shall be capable of withstanding test prescribed by § 178.212-6.

(b) The cushioning shall be either paper-faced expanded polystyrene board meeting the requirements of § 178.212-1 or equally efficient performed completely fused closed cell expanded polystyrene.

§ 178.212-5 Gross weight authorized. (a) Seventy-five pounds maximum.

§ 178.212-6 Tests for completed package. (a) A minimum of 4 boxes with inside containers filled with water, and box closed as for shipment shall be capable of withstanding either of the following tests without leakage from or breakage of any inside container or rupture of the outside containers:

(1) Drop test onto solid concrete; each box should be subjected to not more than one of the series of tests:

Box No. 1—Flat drop on bottom from height of 4 feet.
Box No. 2—Flat drop on side from height of 4 feet.
Box No. 3—Flat drop on end from height of 4 feet.
Box No. 4—Flat drop on top from height of 2 feet.

(2) Swing test on boxed glass swing test apparatus as prescribed by spec. 1A (§178.1); each box shall be swung from 75 inches distance once on each of the six faces.

(b) Tests prescribed by paragraph (a) of this subsection must be conducted prior to initial use of the package and shall be repeated on the change of any components of the package.

§ 178.212-7 Closing for shipment. (a) By any method capable of withstanding tests prescribed by § 178.212-6.

§ 178.212-8 Markings. (a) On each container. Symbol in rectangle as follows:

DOT-12R***

(1) Stars to be replaced by authorized gross weight (for example, DOT-12R75). The letters NRC, located just above or below the DOT mark, to indicate a nonreusable container.

(2) Name or symbol of person making the other marks specified in this section and located on the same face as those other marks. Symbol, if used, must be registered with the Director, OHMT.

(3) Size of markings. Specification markings prescribed in paragraph (a)(1) of this subsection must be at least ½ inch high; other markings must be legible.

---

§ 178.214 Specification 23F; fiberboard boxes.

§ 178.214-1 Compliance. (a) Required in all details.

§ 178.214-2 Definitions. (a) Terms such as "200 pound test" mean minimum strength, Mullen or Cady test.

(b) "Joints" are where edges of parts of box are connected together in setting up the box. Generally done by box maker.

(c) "Seams" are where edges of parts of box are visible, except joints, when box is closed.

§ 178.214-3 Solid fiberboard. (a) To be 3-ply or more; both outer plies waterproofed.

§ 178.214-4 Corrugated fiberboard. (a) Both outer facings water resistant; corrugated sheets at least 0.009" thick; all parts securely glued together throughout all contact areas; minimum combined weight of facings not less than 84 pounds per 1,000 square feet, except when only one lining tube is used as provided by § 178.214-15(b), minimum combined weight of facings must be not less than 138 pounds per 1,000 square feet.

§ 178.214-5 Stitching staples. Stitching staples must be made in such a configuration that their holding capability as installed will not be less than that of flat steel staples 3/32 x 0.019 inch in cross section and not less than 7/16 inch wide. Material used must be at least equivalent to copper coated steel in non-sparking quality.

§ 178.214-6 Tape. (a) Coated with glue at least equal to No. 1¾ Peter Cooper standard. Cloth tape of strength, across the wool, at least 70 units, Elmendorf test. Sisal tape of 2 sheets of No. 1 Kraft paper, total weight 80 pounds per ream (500 sheets, 24" x 36"); sheets to be combined with asphalt and reinforced by unspun sisal fibers completely embedded in the asphalt and extending across the tape.

§ 178.214-7 Test. (a) Acceptable board must have prescribed strength, Mullen or Cady test, under test as follows:

(1) Clamp board firmly in machine and turn wheel thereof at constant speed of approximately 2 revolutions per second.

(2) Six punctures required, 3 from each side; all results but one must show prescribed strength.

(3) Board failing may be retested by making 24 punctures, 12 from each side; when all results but 4 show prescribed strength the board is acceptable.

(4) For corrugated fiberboard, double pop tests may be disregarded.

§ 178.214-8 Type authorized. (a) Of solid fiberboard; 1-piece, or 3-piece without recessed heads, fitted with lining tube or lining tubes as prescribed in § 178.214-15, except that lining tubes are not required for boxes used for shipments of high explosives packed in accordance with § 173.63(a)(3) or electric blasting caps packed in accordance with § 173.66(g)(1), or when box is constructed of 1-piece of not less than 600-pound test board weighing not less than 300 pounds per 1,000 square feet. Boxes having handholes may be used when approved by the Director, OHMT.

§ 178.214-9 Inside packing and size limits. (a) As prescribed in § 178.214-15.

§ 178.214-10 Forming. (a) Parts must be cut true to size and so creased and slotted as to fit closely into position without cracking, surface breaks, separation of parts outside of crease, or undue binding.

§ 178.214-11 Joints. (a) Lapped, 1½" from center of scoreline except as in § 178.214-12, stitched at 2½" intervals and within 1" of each end of joint; double-stitched (2 parallel stitches) at each end of joint over 18" long; or lapped not less than 1¼" and firmly glued throughout entire area of contact with a glue or adhesive which cannot be dissolved in water after the film application has dried.

§ 178.214-12 Flanged heads. (a) Must have 4 flanges, at least 1" long above fillet, on each head. Recessed flanged heads not authorized.

§ 178.214-13 Seams which are to be stitched. (a) Overlap, if any, required to be at least 1½" from center of scoreline except as in § 178.214-12.

§ 178.214-14 Flap closures. (a) Flaps must butt or have full overlap excepting that inner flaps may overlap ½ inch.

§ 178.214-15 Authorized gross weight (when packed) and parts required. (a) Box to be of solid fiberboard, special waterproofed, at least 300-pound test, and weighing at least 250 pounds per thousand square feet. Tubes to be of solid or corrugated fiberboard at least 200-pound test and of 1-piece, or as provided in subparagraph (1), with adjoining edges stitched, taped, or glued. Glued or stitched lap not less than 1¼". Lap must be firmly glued throughout entire area of contact with glue or adhesive which cannot be dissolved in water after the film application has dried.

(1) Or, box shall have one tube liner of solid fiberboard weighing at least 283 pounds per 1,000 square feet with joint or joints either stitched or glued as prescribed in paragraph (a). One end of the tube may have a handhole approximately ¾" deep located at the center of the top and a perforation with a minimum of ⅛" cuts and ⅛" webs extending from the handhole to the bottom.

(b) Authorized gross weight: 65 pounds when 2 or more lining tubes are used to divide the box into 2 or more compartments; 65 pounds when 1 or more lining tubes are used and contents will consist of 1 cartridge only or of black powder in bags; 65 pounds when boxes without lining tubes are used for shipments of high explosives packed in accordance with § 173.63(a)(3) or electric blasting caps packed in accordance with § 173.66(g)(1); 35 pounds in all other cases except that boxes having a single solid fiberboard lining tube, the fiberboard weighing at least 283 pounds per 1,000 square feet, or corrugated fiberboard lining tube as prescribed in § 178.214-4(a), are authorized for 65 pounds gross weight.

§ 178.214-16 Closing for shipment. (a) By any method capable of withstanding tests prescribed by § 178.214-20 without failure.

§ 178.214-17 Marking. (a) On each container. Symbol in rectangle as follows:

DOT-23F***

(1) Stars to be replaced by authorized gross weight (for example DOT-23F35 or DOT-23F65).

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

(3) Size of markings: Specification markings prescribed in paragraph (a)(1) in § 178.214-17 must be at least ½" high; other markings must be legible.

§ 178.214-18 Special tests. (a) By whom and when. By or for each plant making the boxes, at beginning of manufacture and at six-

month intervals thereafter, on the largest size by weight. Smaller sizes need not be tested if they have the same or equivalent construction.

§ 178.214-19 Material. (a) Box material (special waterproofed board) must be 300-pound test board and weigh at least 250 pounds per thousand square feet when commercially dry.

(b) Box material must also have 200-pound test strength and moisture content not over 30 percent as follows:

(1) Immediately after exposure for 3 days to 90 percent humidity at 75° F.

(2) Immediately after it has been contact in with water for 3 hours under 3" head at 75° F.

NOTE: The test shall be conducted on a sample no greater than 8 inches in diameter when exposed to water. The sample shall be rigidly fastened to a water column device so constructed as to provide at least a 3 inch head of water on the outer surface of the fiberboard sample. The water column device must be suspended in such manner that free circulation of air on the inner surface of fiberboard sample which is not exposed to water is permitted. After contact with water for 3 hours under conditions specified, the water column device shall be emptied, the sample blotted, and immediately subjected to Mullen or Cady test. (A 6- inch diameter pipe having a welded flange to which the sample is secured by a bolted ring flange is acceptable.)

§ 178.214-20 Completed containers. (a) Samples must pass the following immediately after exposure for 2 weeks to 90 percent humidity at 75° F; loaded containers shall contain dummy contents of shape and weight of the expected contents, and shall be closed in same manner as for shipment:

(1) Three loaded samples to be tested. Each must withstand 200 drops in standard 7-foot revolving test drum with pointed hazard in place, without spilling any contents.

(2) Three loaded samples to be tested. Each must withstand end to end pressure of at least 500 pounds without deflection of over 1½".

(3) Three empty samples to be tested. Each must withstand top to bottom pressure of at least 500 pounds without deflection of over ½ inch.

(b) As an alternate to the drum test specified in paragraph (a), 3 loaded samples must pass the drop test specified below:

(1) Box shall be dropped from height of 2 feet.

(2) Identification of face, edge, and corners. Facing one end (with the manufacturer's joint on the observer's right), the top of the box is designated as 1, the right side as 2, the bottom as 3, and the left side as 4. The near end is designated as 5 and the far end as 6. The edges are identified by the number of the two faces which make that edge, as for example, 1–2 identifies the edge where the top and right side meet and 2–5 the edge having the manufacturer's joint. The corners are identified by the number of the three faces which meet to form that corner, as for example, 1–2–5 identifies the corner where the top, the right side, and the near end meet.

(c) Drop sequence as follows:

(1) A corner drop on 1–2–5.

(2) An edge drop on the shortest edge radiating from that corner (usually 2–5).

(3) An edge drop on the next shortest edge radiating from that corner (usually 1–5).

(4) An edge drop on the longest edge radiating from that corner (usually 1–2).

(5) A flatwise drop on one of the smallest faces (usually end 5 or 6).

(6) A flatwise drop on the opposite smallest face.

(7) A flatwise drop on one of the medium faces (usually side 2 or 4).

(8) A flatwise drop on the opposite medium face.

(9) A flatwise drop on one of the largest faces (usually top 1 or bottom 3).

(10) A flatwise drop on the opposite large face.

This completes one cycle of ten drops. Commence the next cycle with a drop on the corner diagonally opposite through the box to the corner on which the first drop was made, on corner 3–4–6. Commence the third cycle of ten drops with corner 1–4–5. Each loaded container must withstand 3 cycles without spilling or sifting of contents.

---

§ 178.218 Specification 23G; special cylindrical fiberboard box for high explosives.

§ 178.218-1 Compliance. (a) Required in all details.

§ 178.218-2 Definition. (a) Terms such as "200-pound test" mean minimum strength, Mullen or Cady test.

§ 178.218-3 Side walls, ends, and interior. (a) Side walls. To be not less than four-ply of continuous fiber sheets convolutely or spirally wound; combined strength to be not less than 300 pounds, dry; combined thickness to be not less than 0.050" for containers not exceeding 10 pounds gross weight and not less than 0.060" for containers over 10 pounds gross weight.

(b) Ends. To be of one or more plies of fiberboard sufficiently strong to withstand prescribed tests. Wax or plastic material with fiberboard inserts authorized provided the completed container will withstand the prescribed tests at temperature from zero to one hundred thirty degrees F.

(c) Interior of the container must be lined or so treated as to prevent penetration by the commodity with which the container is filled for shipping.

§ 178.218-4 Stitching staples. Stitching staples must be made in such a configuration that their holding capability as installed will not be less than that of flat steel staples 7/32 x 0.019 inch in cross section and not less than 7/16 inch wide. Material used must be at least equivalent to copper coated steel in non-sparking quality.

§ 178.218-5 Tape. (a) Coated with animal glue at least equal to No. 1¾ Peter Cooper standard or other adhesive equivalent in tensile properties and resistance to deterioration. Cloth tape of strength, across the wool, at least 70 units, Elmendorf test. Sisal tape of 2 sheets of No. 1 Kraft paper, total weight 80 pounds per ream (480 sheets, 24" x 36"); sheets to be combined with asphalt and reinforced by unspun sisal fibers completely embedded in the asphalt and extending across the tape.

§ 178.218-6 Test of board. (a) Acceptable board must have prescribed strength, Mullen or Cady test, under test as follows:

(1) Clamp board firmly in machine and turn wheel thereof at constant speed of approximately 2 revolutions per second.

(2) Six punctures required, 3 from each side; all results but one must show prescribed strength.

(3) Board failing must be retested by making 24 punctures, 12 from each side; when all results but 4 show prescribed strength the board is acceptable.

§ 178.218-7 Type of container authorized. (a) One cylindrical tube or;

(b) Two cylindrical tubes butted together and taped or glued completely around circumference at points to make positive closure.

(c) Open ends to be closed in such a manner as to give complete closure which will withstand prescribed tests.

§ 178.218-8 (Deleted)

§ 178.218-9 Authorized size and weight limit. (a) Maximum authorized outside diameter of container is 12".

(b) Maximum authorized gross weight of container is 65 pounds.

§ 178.218-10 Marking. (a) On each container by symbol as follows:

DOT-23G***

(1) Stars to be replaced by authorized gross weight (for example, DOT-23G40, DOT-23G65, etc.).

(2) Name or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

(3) Size of markings. Specification markings prescribed in paragraph (a)(1) in § 178.218-10 must be at least ½" high; other markings must be legible.

§ 178.218-11 Special tests. (a) By whom and when. By or for each plant making the boxes, at beginning of manufacture and at 6-month intervals thereafter, on the largest size by weight. Smaller sizes need not be tested if they have the same or equivalent construction.

§ 178.218-12 Material. (a) Box material must be not less than 300 pound test board when commercially dry.

(b) Box material must also have 200-pound test strength, moisture content not over 30 percent and puncture strength not less than 200 units, as determined by General Electric Puncture Tester using an average obtained from a series of five tests, as follows:

(c) Immediately after exposure for 3 days under either of the following conditions:

(1) 70 percent humidity at 100° F.

(2) 90 percent humidity at 75° F.

§ 178.218-13 Completed containers. (a) Samples must pass the following tests immediately after exposure for 2 weeks to 90 percent humidity at 75° F. or 70 percent humidity at 100° F.; loaded containers shall contain dummy contents of shape and weight same as expected contents.

(1) Three loaded samples to be tested. Each must withstand end to end pressure of at least 500 pounds without deflection of over 1½"; speed of compression tester to be ½" per minute plus ¼" minus ¼" per minute.

(2) Three loaded samples to be tested. Each must withstand side to side pressure of at least 500 pounds without deflection of over ½"; except that for boxes with fluted crimped ends the deflection shall not exceed ¾"; speed of compression tester to be ½" per minute plus ¼" minus ¼" per minute.

(3) Three loaded samples to be tested. Each must withstand, without rupture, four 4-foot drops diagonally on the end more likely to cause rupture on impact.

(4) Three loaded samples to be tested. Each must be dropped once, flat on its side, across another similar package lying flat upon the ground with its longitudinal axis at right angles to container dropped. Drops must be made from a height four feet above the topmost part of the container on the ground.

(b) As an alternate to compression test requirements of paragraphs (a)(1) and (a)(2) of this section, samples must pass the following tests immediately after exposure for 2 weeks to 90 percent humidity at 75° F. or 70 percent humidity at 100° F., loaded containers shall contain dummy contents of shape and weight same as expected contents. Static loading tests as specified herein must be conducted with the prescribed weight in place for at least 60 minutes, with deflection of container not in excess of the following:

(1) Three loaded samples to be tested. Each container must be capable of withstanding end-to-end pressure of at least 375 pounds without deflection over 1½ inches.

(2) Three loaded samples to be tested. Each container must be capable of withstanding side-to-side pressure of at least 350 pounds without deflection over ½ inch.

---

§ 178.219 Specification 23H; fiberboard boxes.

§ 178.219-1 Compliance. (a) Required in all details.

§ 178.219-2 Definitions. (a) Terms such as "200-pound test" mean minimum strength, Mullen or Cady test.

(b) "Joints" are where edges of parts of box are connected together in setting up box.

(c) "Seams" are where edges of parts of box are visible, except joints, when box is closed.

§ 178.219-3 Solid fiberboard. (a) To be 3-ply or more; both outer plies waterproofed.

§ 178.219-4 Stitching staples. Stitching staples must be made in such a configuration that their holding capability as installed will not be less than that of flat steel staples 3/32 × 0.019 inch in cross section and not less than 7/16-inch wide. Material used must be at least equivalent to copper coated steel in nonsparking quality.

§ 178.219-5 Tape. (a) Coated with glue at least equal to No. 1½ Peter Cooper standard. Cloth tape of strength, across the wool, at least 70 units, Elmendorf test. Sisal tape of 2 sheets of No. 1 Kraft paper, total weight 80 pounds per ream (500 sheets, 24" × 36"); sheets to be combined with asphalt and reinforced by unspun sisal fibers completely embedded in the asphalt and extending across the tape.

§ 178.219-6 Test. (a) Acceptable board must have prescribed strength, Mullen or Cady test, under test as follows:

(1) Clamp board firmly in machine and turn wheel thereof at constant speed of approximately 2 revolutions per second.

(2) Six punctures required, 3 from each side; all results but one must show prescribed strength.

(3) Board failing may be retested by making 24 punctures, 12 from each side; when all results but 4 show prescribed strength the board is acceptable.

§ 178.219-7 Type authorized. (a) Of solid fiberboard, telescoping type construction without recessed heads. Box to consist of top and bottom sections, divided equally or unequally, and inner lining tube or full depth cover 2-piece telescope type in which case the lining tube may be omitted. The lining tube, when required, must be staple stitched to the lower section of the box to give in effect a 2-piece box.

(b) Hand-holes oval in shape, not more than 1 inch in width by 3 inches in length and horizontal with top score line, are authorized in ends of top section of full depth cover telescope type boxes.

§ 178.219-8 Inside packing and size limits. (a) As prescribed in §178.219-11.

§ 178.219-9 Forming. (a) Parts must be cut true to size and so creased and slotted as to fit closely into position without cracking, surface breaks, separation of parts outside of crease, or undue binding.

§ 178.219-10 Joints. (a) Lapped at least 1½" from center of scoreline; staple stitched at 2½" intervals and within 1" of each end of joint; 2 banks of staple stitches in each joint.

§ 178.219-11 Authorized gross weight (when packed) and parts required. (a) Box to be of solid fiberboard, special waterproofed at least 300-pound test, and weighing at least 250 pounds per thousand square feet. Tubes to be of solid fiberboard at least 200-pound test and of 1 piece with adjoining edges staple stitched or taped.

(b) Authorized gross weight: 65 pounds when 2 or more lining tubes are used to divide the box into 2 or more compartments; 65 pounds when 1 or more lining tubes are used and contents will consist of 1 cartridge only or of black powder in bags; 35 pounds in all other cases except that boxes having a single solid fiberboard lining tube, the fiberboard weighing at least 283 pounds per 1,000 square feet, are authorized for 65 pounds gross weight. Boxes of 2-piece telescope type having full depth cover are authorized for 65 pounds gross weight.

§ 178.219-12 Closing for shipment. (a) By any method capable of withstanding tests prescribed by § 178.219-16 without failure.

§ 178.219-13 Marking. (a) On each container. Symbol in rectangle as follows:

DOT-23H***

(1) Stars to be replaced by authorized gross weight (for example, DOT-23H35 or DOT-23H65).

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

(3) Size of markings. Specification markings prescribed in paragraph (a)(1) of this section must be at least ½" high; other markings must be legible.

§ 178.219-14 Special tests. (a) By whom and when. By or for each plant making the boxes, at beginning of manufacture and at six-month intervals thereafter, on the largest size by weight. Smaller sizes need not be tested if they have the same or equivalent construction.

§ 178.219-15 Material. (a) Box material (special waterproofed board) must be 300-pound test board and weigh at least 250 pounds per thousand square feet when commercially dry.

(b) Box material must also have 200-pound test strength and moisture content not over 30 percent as follows:

(1) Immediately after exposure for 3 days to 90 percent humidity at 75° F.

(2) Immediately after it has been in contact with water for 3 hours under 3" head at 75° F.

NOTE: The test shall be conducted on a sample no greater than 6 inches in diameter when exposed to water. The sample shall be rigidly fastened to a water column device so constructed as to provide at least a 3 inch head of water on the outer surface of the fiberboard sample. The water column device must be suspended in such manner that free circulation of air on the inner surface of fiberboard sample which is not exposed to water is permitted. After contact with water for 3 hours under conditions specified, the water column device shall be emptied, the sample blotted, and immediately subjected to Mullen or Cady test. (A 6 inch diameter pipe having a welded flange to which the sample is secured by a bolted ring flange is acceptable.)

§ 178.219-16 Completed containers. (a) Samples must pass the following immediately after exposure for 2 weeks to 90 percent humidity at 75° F; loaded containers shall contain dummy contents of shape and weight of the expected contents, and shall be closed in same manner as for shipment.

(1) Three loaded samples to be tested. Each must withstand 200 drops in standard 7-foot revolving test drum with pointed hazard in place, without spilling any contents.

(2) Three loaded samples to be tested. Each must withstand end to end pressure of at least 500 pounds without deflection of over 1½".

(3) Three empty samples to be tested. Each must withstand top to bottom pressure of at least 500 pounds without deflection of over ½ inch.

(b) As an alternate to the drum test specified in paragraph (a), 3 loaded samples must pass the drop test specified below:

(1) Box shall be dropped from height of 2 feet.

(2) Identification of face, edge, and corners. Facing one end (with the manufacturer's joint on the observer's right), the top of the box is designated as 1, the right side as 2, the bottom as 3, and the left side as 4. The near end is designated as 5 and the far end as 6. The edges are identified by the number of the two faces which make that edge, as for example, 1–2 identifies the edge where the top and right side meet and 2–5 the edge having the manufacturer's joint. The corners are identified by the number of the three faces which meet to form that corner, as for example, 1–2–5 identifies the corner where the top, the right side, and the near end meet.

(c) Drop sequence as follows:

(1) A corner drop on 1–2–5.

(2) An edge drop on the shortest edge radiating from that corner (usually 2–5).

(3) An edge drop on the next shortest edge radiating from that corner (usually 1–5).

(4) An edge drop on the longest edge radiating from that corner (usually 1–2).

(5) A flatwise drop on one of the smallest faces (usually end 5 or 6).

(6) A flatwise drop on the opposite smallest face.

(7) A flatwise drop on one of the medium faces (usually side 2 or 4).

(8) A flatwise drop on the opposite medium face.

(9) A flatwise drop on one of the largest faces (usually top 1 or bottom 3).

(10) A flatwise drop on the opposite large face.

This completes one cycle of ten drops. Commence the next cycle with a drop on the corner diagonally opposite through the box to the corner

on which the first drop was made, on corner 3-4-6. Commence the third cycle of ten drops with corner 1-4-5. Each loaded container must withstand 3 cycles without spilling or sifting of contents.

§ 178.224 Specification 21C; fiber drum.

§ 178.224-1 Construction requirements. (a) Parts and dimensions as follows:

(1) Drums for dry products; minimum requirements unless otherwise stated.

Net weight of contents (pounds) (not over)	Capacity, maximum (gallons) (not over)	Diameter, inside maximum (inches)	Sidewall strength (pounds)[1] [2]	Tops and Bottoms				
				Fiber[3]		Steel	Wood (Thickness, Inches)	
				Thickness (inches)	Strength[1]	(U.S. gauge)	Solid[4] [5] [6]	Plywood, at least 3-ply construction
60	5	11¼	500	.090	600	28	⅞	⅜
60	20	18½	600	.120	800	28	⅞	⅜
115	20	18½	700	.120	800	26	⅞	⅜
115	55	23	800	.150	1100	26	⅞	⅝
250	55	23	900	.200	1200	24	⅞	⅝
400	75	23	1000	.220	1300	24	⅞	⅝

[1] Mullen or Cady Test. Either of the following test methods may be used. When more than single ply, test shall be determined from the summation of the tests of individual plies, or, when test is made on a complete drum, the punctures shall be made from the exterior to the interior surface, in which case the values for sidewall shall be not less than 80 percent of the value in the above table and the values for fiber tops and bottoms shall be not less than the value in the above table. There shall be a minimum of six tests and the average shall be not less than the prescribed minimum requirements.

[2] Sidewalls. Sidewalls to be convolutely wound of fiberboard at least .012 inch thick, the plies being secured together with adhesives, or may consist of an outer shell and an inner tube each convolutely wound with each fiberboard ply not less than .012 inch thick and secured together with adhesive. Drums may contain barrier or lining material.

[3] When made of 2 or more discs, the discs must be fastened together with adhesive.

[4] Joints in head must be Linderman joints, glued, except as specified in Footnote 5.

[5] Wooden heads at least one-half inch thick having kraft paper glued on both sides at all contact areas with waterresistant adhesive are authorized provided, tests prescribed in § 178.224-2 are successful. Joints of any type are authorized.

[6] Minimum thickness may be reduced to ⅞ inch for lumber dressed two sides.

§ 178.224-2 Type tests. (a) Conditioning. Prior to testing, drums shall be conditioned at 50 percent relative humidity plus or minus 2 percent and 75° F. plus or minus 3° F. for at least 48 hours.

(b) Drop tests. Samples taken at random filled with dry finely powdered material to authorized net weight and closed as for use must withstand the following four foot-drop tests on the part specified without leakage or serious rupture. No single drum shall be subjected to more than one of the following tests. Drums with wood heads shall be dropped with grain of wood in cover parallel to concrete surface.

(1) Top chime, diagonally onto solid concrete.

(2) Bottom chime, diagonally onto solid concrete.

(3) Sidewall, over a 2-inch x 6-inch timber resting on solid concrete with 6-inch leg vertical; drop to be made with drum in horizontal position at right angles to the timber.

(4) The closure or on any other part which may be considered weaker onto solid concrete.

(c) Compression test. An empty drum shall withstand either of the following compression tests, in accordance with the following table, without buckling of the sidewalls sufficient to cause damage to its expected contents; but in no case shall the maximum deflection be more than one inch.

Maximum net weight	Maximum capacity (gallons)	Maximum inside diameter (inches)	Compression (pounds)	
			Static[1]	Dynamic[2]
60	5	11¼	1200	1600
60	20	18½	1200	1600
115	20	18½	1200	1600
115	55	23	1500	2000
250	55	23	1800	2400
400	75	23	2100	2900

[1] Static test. Compression as specified must be applied to full area of top cover of drum for period of 48 hours.

[2] Dynamic Test. Compression as specified must be applied end to end. Speed of compression tester to be one-half inch plus or minus one fourth inch per minute.

(d) The tests described above must be made by any company starting production, for each plant location of manufacture, on samples taken at random of each type and diameter of container and must be repeated every 4 months or less during production. Samples last tested must be retained until further tests are made. The tests and procedure described may be conducted at one central laboratory when testing facilities are not available at all plants.

§ 178.224-3 [Deleted]

§ 178.224-4 Marking. (a) On each container as follows:

(1) Drums must be marked DOT-21C followed by the authorized net weight to which drum was constructed, for example, DOT-21C115.

(2) Name or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above, below, or following those marks. Symbol, if used, must be registered with the Director, OHMT.

§ 178.225 Specification 21P; fiber drum overpack for inside plastic container.

§ 178.225-1 Compliance. (a) Required in all details.

§ 178.225-2 Construction requirements. (a) Fiber drum overpack for inside plastic containers as prescribed in Part 173. Fit of fiber drum overpack shall provide support for inside plastic container in such manner as to avoid wrinkling, buckling, or suspension of inside plastic container by any closure protruding through top head.

(b) Fiber sidewalls shall consist of one or more multiple-ply shells or tubes, convolutely wound of fiberboard at least 0.012 inch thickness with plies of each component secured together with adhesive; steel parts used shall be of low carbon, open-hearth, or electric steels; drum overpack shall be of tight-head or full removable cover type, straight sided, with top and bottom heading secured to sidewall by an efficient means in accordance with the following detailed minimum requirements:

Marked[1] (rated) capacity of inside plastic container not over (gallons)	Authorized maximum net weight of liquid contents not over (pounds)	Fiber drum overpack parts[1] [2]								
		Sidewall	Top heads and bottom heads				Combination fiber-steel bottoms			
			All fiber[3]		All steel		Fiber component		Steel component	
		Strength[2] pounds	Thickness (inch)	Strength[2] (pounds)	Gauge	Thickness (inch)	Thickness (inch)	Strength[2] (pounds)	Gauge	Thickness[4] (inch)
5½	105	600	0.120	800	28	0.0129	.....	.....	.....	.....
15	245	700	0.150	1100	26	0.0159	0.090	600	28	0.0129
30	350	900	0.200	1200	24	0.0209	0.120	800	26	0.0159
30	450	1000	0.220	1300	24	0.0209	0.150	1100	26	0.0159
55	600	1200	0.240	1500	24	0.0209	0.150	1100	26	0.0159

[1] For capacity tolerances refer to applicable specifications of inside plastic containers.

[2] Mullen or Cady test. Either of the following test methods may be used. When more than single ply, test shall be determined from the summation of the tests of individual plies, or when test is made on a complete drum, the punctures shall be made from the exterior to the interior surface, in which case the values for sidewall shall be not less than 80 percent of the value in the above table and the values for fiber tops and bottoms shall be not less than the value in the above table. There shall be a minimum of six tests and the average shall be not less than the prescribed minimum requirements.

[3] When made of 2 or more discs, the discs must be bonded together with adhesive.

[4] Thickness shall be measured at any point on the steel part not less than ¾ inch from an edge.

[5] Two holes not exceeding 1¼ inch each are permitted diametrically opposite each other in the overpack body and three holes not exceeding ¾ inch in diameter on centers 120 degrees apart in the bottom head. Top head may have not more than two holes of suitable size to provide for protruding closures. Closures shall not protrude above plane of top chime.

[6] Overpack interior shall be free of projections, burrs, or any edges that might cause damage to inside plastic container.

§ 178.225-3 Marking. (a) Maker of overpack and assembler of the composite container shall place a marking on side of container by printing, lithography or stamping with weather resistant ink in letters not less than ½ inch high as follows:

(1) Marking by maker of overpack.

(i) DOT-21P***; stars to be replaced by the authorized net weight for liquid products for which drum was constructed, for example, DOT-21P.450.

(ii) Name or symbol of maker must be registered with the Director, OHMT and be located just above, below, or following the mark specified in subparagraph (a)(1)(i) of this section.

(2) Marking by assembler of composite container.

(i) Maker or other party assuming responsibility for compliance with specification requirements shall add a marking to the overpack maker's marking as specified by subparagraph (a)(1)(i) of this section identifying the inside plastic container specification number. For example, DOT-21P.450 2SL. "STC" shall be added to the marking when inside container is authorized only for single trip service. For example, DOT-21P.450 2U STC.

(ii) The name or symbol of the assembler to be located near the marking specified in subparagraph (a)(2)(i) of this section; symbol must be registered with the Director, OHMT.

§ 178.225-4 Compression test. (a) Prior to testing, drums shall be conditioned at 50 percent plus or minus 2 percent relative humidity and 75° F. plus or minus 3° F. for at least 48 hours.

(b) An empty fiber drum overpack shall withstand either of the following compression tests without buckling of the sidewall sufficient to cause

damage, but in no case shall the maximum top to bottom deflection be more than ½ inch:

Fiber drum overpack for plastic inside container of marked (rated) capacity	Compression	
Not over (gallons)	Static[1] (pounds)	Dynamic[2] (pounds)
15	1125	1500
30	1800	2400
55	2400	3200

(c) Test to be made at start of production and repeated at 4-month intervals for each size of each type drum overpack manufactured. Record of test results shall be maintained in current status by each manufacturer at each producing plant.

§ 178.225-5 Assembly and testing of composite container. (a) The method employed for assembly shall be such as not to cause damage to either component.

(b) The party doing assembly shall be responsible for compliance with § 178.225-2(a) and for compliance with test requirements specified by applicable inside plastic container specifications in Part 178.

§ 178.226 Specification 29; mailing tubes.

§ 178.226-1 Compliance. (a) Required in all details.

§ 178.226-2 Cushioning. (a) Inside containers, if any, must fit closely in tube or be properly cushioned.

§ 178.226-3 Construction. (a) Of fiber at least ⅛" thick; metal bottom and metal screw-cap top, or telescope type with fixed metal ends.

§ 178.226-4 Marking. (a) Each container must be marked to show:

(1) DOT-29.

(2) The name or symbol of person making the mark specified in paragraph (a)(1) of this section. Symbol, if used, must be registered with the Director, OHMT.

SUBPART G

SPECIFICATIONS FOR BAGS, CLOTH, BURLAP, PAPER OR PLASTIC

§ 178.230 Specification 36A; lined cloth bags (triplex).

§ 178.230-1 Compliance. (a) Required in all details.

§ 178.230-2 Capacity. (a) Not over 100 pounds, net.

§ 178.230-3 Cloth. (a) Osnaburg cotton cloth at least 8½ ounces per square yard.

Note 1. Until further order of the Department, cloth of 40 inch width, 2.11 yards per pound, may be used, provided creped paper is of two way stretch construction.

§ 178.230-4 Paper. (a) Shipping sack Kraft, creped. A "ream" as used herein means 500 sheets 24" × 36" before creping.

§ 178.230-5 Assembly. (a) Either of the following:

(1) Single bag. Cloth-lined with 2 sheets of creped paper, each at least 35 pounds per ream, cemented together and to cloth. Combined tensile strength at least 100 pounds, warp and fill.

(2) Triple Bag. Outer of cloth; intermediate of 2 thicknesses of creped paper, each at least 30 pounds per ream, cemented together with asphalt so as to weigh 90 pounds per ream; inner of creped paper at least 45 pounds per ream.

§ 178.230-6 Seams. (a) To be dust-tight.

§ 178.230-7 Test. (a) The finished container, filled and closed as for shipment, must be capable of withstanding drop test of 4 feet without sifting.

§ 178.230-8 Marking. (a) Marking on each container by marks at least 1" high as follows:

(1) DOT-36A.

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

§ 178.230-9 Closing for shipment. (a) By double tying with steel wires at least No. 16 Birmingham wire gauge; inner bags, if any, to have edges rolled in before outer bag is tied.

§ 178.233 Specification 36B; burlap bags, lined.

§ 178.233-1 Compliance. (a) Required in all details.

§ 178.233-2 Capacity. (a) Not over 100 pounds, net.

§ 178.233-3 Burlap. (a) At least equal in quality and strength to 10-oz., 40" (10'40), Calcutta A and/or B mill grade. Thread count at least 11 per 37.40", porter, and 12 per inch, shot; this to be an average of 6 counts.

§ 178.233-4 Paper. (a) Shipping sack Kraft, creped; at least 25 pounds per ream (500 sheets 24" × 36") before creping.

§ 178.233-5 Assembly. (a) Burlap to be lined with 2 sheets of creped paper cemented together and to burlap.

(b) Adhesive between paper sheets to be asphalt, melting point 150° F., at minimum rate of 100 pounds per ream.

(c) Adhesive between paper and burlap to be either:

(1) Curing rubber latex at minimum rate of 40 pounds, dry weight, per ream.

(2) Asphalt, any desirable type, at minimum rate of 110 pounds per ream.

§ 178.233-6 Stretch of paper lining. (a) At least equal to that of burlap in direction of warp and fill and equal to 10 percent in diagonal direction.

§ 178.233-7 Seams. (a) By cementing or taping to give seam strength at least equal to that of bag material and prevent sifting.

§ 178.233-8 Test. (a) The finished container, filled and closed as for shipment, must be capable of withstanding drop test of 4 feet on the butt without sifting or rupture of burlap or liners.

§ 178.233-9 Marking. (a) Marking on each container by marks at least 1" high as follows:

(1) DOT-36B.

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

§ 178.233-10 Closing for shipment. (a) As specified for seams, § 178.233-7; or, by tying with 2 steel wires of at least No. 16 Birmingham wire gauge.

§ 178.234 Specification 36C; burlap bags, paper lined.

§ 178.234-1 Compliance. (a) Required in all details.

§ 178.234-2 Capacity. (a) Not over 100 pounds, net.

§ 178.234-3 Burlap. (a) At least equal in quality and strength to 7½ ounce, 40 inch (7½'40) Calcutta A and/or B mill grade. Thread count at least 9 per 37.40 inch, porter, and 9 per inch, shot; this to be an average of 6 counts.

§ 178.234-4 Paper. (a) Shipping sack Kraft, creped; at least 30 pounds per ream (500 sheets 24" × 36") before creping.

§ 178.234-5 Assembly. (a) Burlap to be lined with 1 sheet of creped paper cemented to burlap.

(b) Adhesive between paper and burlap to be asphalt, any desirable type, at a minimum rate of 110 pounds per ream.

§ 178.234-6 Stretch of paper lining. (a) At least equal to that of burlap in direction of warp and fill and equal to 10 percent in diagonal direction.

§ 178.234-7 Seams. (a) By cementing or taping to give seam strength at least equal to that of bag material and prevent sifting.

§ 178.234-8 Test. (a) The finished container, filled and closed as for shipment, must be capable of withstanding drop test of 4 feet on the butt without sifting or rupture of burlap liners.

§ 178.234-9 Marking. (a) Marking on each container by marks at least 1" high as follows:

(1) DOT-36C

(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

§ 178.234-10 Closing for shipment. (a) As specified for seams, § 178.234-7; or, by tying with 2 steel wires of at least No. 16 Birmingham wire gauge, or any other type of equal efficiency that will be sift-proof and insure equal strength to body of bag.

§ 178.236 Specification 44B; multiwall paper bags.

§ 178.236-1 Compliance. (a) Required in all details.

§ 178.236-2 Paper. (a) Shipping sack kraft paper, plain, or extensible plain, shall conform to the average requirements specified in paragraphs (a)(1) or (a)(2) of this section.

(1) Shipping sack, kraft paper, plain:[1]

Nominal basis weight (500 sheets, 24" × 36")[2]	Minimum average dry tearing strength		Minimum average dry tensile strength per inch width	
	M.D.[3]	Total M.D. plus C.D.[3]	C.D.[3]	Total C.D. plus M.D.[3]
Pounds	Grams	Grams	Pounds	Pounds
40	88	188	14	41
50	110	235	19	53
60	132	282	23	64
70	154	329	27	74

[1] Shipping sack kraft paper, plain, is paper that consists of all sulphate pulp and no other fiber, and which has not been treated by coloring, bleaching, creping, coating, spraying, laminating or impregnating for special qualities. Paper shall have a degree of water resistance as secured by normal rosin sizing and shall comply with the requirements in paragraph (a) (1) of this section.

[2] A tolerance of minus 10 percent of the basis weight of individual plies of plain shipping sack kraft paper will be permitted, an average tolerance of minus 5 percent will be permitted in the sum total basis weight of all plies in multi-wall constructions. Variations in excess of specified basis weights will not be considered a defect or deviation. The basis weight of paper means the basis weight as produced by the paper machine, not including finish subsequently applied such as coating or printing.

[3] M.D. means machine direction. C.D. means cross direction.

(2) Shipping sack, extensible kraft paper, plain:[1]

Nominal basis weight (500 sheets, 24" × 36")[2]	Minimum dry tearing strength		Minimum tensile energy absorption, ft.-lbs. per square foot of paper[3]	
	M.D.[3]	Total M.D. plus C.D.[3]	C.D.[3,4]	Total C.D. plus M.D.[3,4]
Pounds	Grams	Grams		
40	88	188	4.5	14.0
50	110	235	5.6	17.0
60	132	282	7.0	23.0
70	154	329	8.0	23.0
80	176	376	9.0	26.0

[1] Extensible shipping sack kraft paper, plain, is paper that consists of all sulphate pulp and no other fiber, and which has not been treated by coloring, bleaching, creping, coating, spraying, laminating or impregnating for special qualities. Paper shall have a degree of water resistance as secured by normal rosin sizing and shall comply with the requirements in paragraph (a) (2) of this section.

[2] A tolerance of minus 10 percent of the basis weight of individual plies of extensible shipping sack kraft paper will be permitted, an average tolerance of minus 5 percent will be permitted in the sum total basis weight of all plies in multi-wall constructions. Variations in excess of specified basis weights will not be considered a defect or deviation. The basis weight of paper means the basis weight as produced by the paper machine, not including finish subsequently applied, such as coating or printing.

[3] M.D. means machine direction. C.D. means cross direction.

[4] Variations in cross-direction tensile energy absorption of not more than 0.5 units below the minimum requirements will be permitted, provided the variations are compensated by an increase in the machine-direction tearing strength in the ratio of twenty units of tearing strength to one unit of tensile energy absorption, and variations in total tensile energy absorption of not more than one unit below the minimum requirements will be permitted, provided the variations are compensated by an increase in the total tearing strength in the same ratio. Similarly, variations in machine-direction tearing strength of not more than ten units below minimum requirements will be permitted, provided variations are compensated by an increase in cross-direction tensile energy absorption in the ratio of one unit of tensile energy absorption to twenty units of tearing strength, and variations in total tearing strength of not more than twenty units below the minimum requirements will be permitted provided the variations are compensated by an increase in the total tensile energy absorption in the same ratio. Conformance with the requirements of table shall be established by comparing the sum of the basis weights and tests for all of the plies specified in the construction of the bag with the sum of the specified basis weights and tests for the respective papers comprising the different plies. All requirements in this table are for a paper conditioned to a relative humidity of 50 percent at a temperature of 23°C (73°F).

(b) Asphalt laminated or polyethylene coated shipping sack kraft paper when used shall comply with the following requirements:

Type paper	Minimum average dry tearing strength		Minimum average dry tensile strength per inch width		Heat resistance hours at 150° F. without impairing function of sack	Maximum average water vapor permeability from both sides at 50 percent R.H. and 73° F. g/m. 2 24 hours	
	M.D.	Total M.D. plus C.D.	C.D.	Total C.D. plus M.D.		Uncreased	Creased[1]
	Grams	Grams	Pounds	Pounds			
Asphalt laminated[2,4]	110	235	19	53	5	90	150
10PE-50							
150-10PE[3]	110	235	19	53	5	70	120
15PE-50							
150-15PE[3]	110	235	19	53	5	45	75

[1] Creasing at 40° F.

[2] Asphalt laminated kraft paper when used as a wall in fabricated sacks, shall conform to the requirements of paragraph (b) of this section and shall consist of kraft paper, the total basis weight of the two paper plies not less than 50 pounds per ream (500 sheets, 24" × 36"), continuously and uniformly laminated together with an average of not less than 25 pounds of asphalt per ream (500 sheets, 24" × 36"). Tolerance of minus 5 percent will be allowed on individual components. The total basis weight of the finished combination shall not exceed 100 pounds per ream (500 sheets, 24" × 36"). An asphalt laminated kraft wall meeting these requirements may be substituted for a plain kraft wall of 50 pounds basis or less, provided it meets the specification.

[3] Polyethylene coated shipping sack kraft paper. The polyethylene coated kraft paper when used as walls in fabricated sacks shall meet the heat resistance and water vapor permeability requirements as specified in the table. A tolerance of minus 10 percent will be allowed for the lot sample average coating weight of polyethylene on shipping sack kraft paper. Minimum samples for testing shall comprise not less than 3 specimens 16 square inches each selected representatively from each polyethylene coated wall of each sack in the lot sample. Where barrier sheets are based on extensible kraft the weight of the barrier material shall be in addition to the basis weight of the paper.

[4] Asphalt laminated extensible kraft paper must consist of two sheets of extensible kraft paper, the total basis weight of the paper in the finished combination being not less than 50 pounds per ream (24" × 36"—500) with neither sheet weighing less than 23 pounds continuously and uniformly laminated together with an average of not less than 25 pounds of asphalt per ream (24" × 36"—500). In determining the basis weight and test conformance of bags containing an asphalt laminated extensible kraft wall, the asphalt laminated extensible kraft wall shall be treated as if it were a single extensible kraft wall or combination of walls of 10 pounds lower total paper basis weight than the sum of the nominal basis weight in the asphalt laminated wall, but in no case shall be treated as less than the equivalent of a 50 pounds basis weight wall.

(c) Laminating materials. Any laminant other than asphalt or other water-vapor barrier walls may be used provided they meet the requirements in paragraph (b) of this section.

(d) All values in paragraphs (a) and (b) of this section are for paper having a moisture content in equilibrium with an atmosphere having a relative humidity of 50 percent plus or minus 2 percent at a temperature of 73° F. plus or minus 3.5° F. following preconditioning of the test specimens to a moisture content between 3 and 5.5 percent by exposure to relatively dry air having a temperature no greater than 140° F.

(e) Conformance of sacks with paper strength requirements shall be established by comparing the sums of the test values for all the walls of the new and unused sack with the sums of the respective strength values specified in paragraphs (a) and (b) of this section for the different walls of the sack.

(1) Variation in cross direction dry tensile strength of not more than 2 units below the minimum requirement based on paragraphs (a) and (b) of this section will be permitted for each wall of the sack, provided the variation is compensated for by a machine direction tearing strength test value in excess of the minimum requirement obtained from the tables, in the ratio of 5 units of tearing strength for each unit of dry tensile strength test below the minimum requirement; and variation in combined dry tensile strength of not more than 4 units below the minimum requirement based on paragraphs (a) and (b) of this section will be permitted for each wall used provided the variation is compensated for by a combined tearing strength test value in excess of the minimum requirement obtained from the tables in the ratio of 5 units of combined tearing strength for each unit of dry tensile strength test below the minimum requirement. Similarly, variation in machine direction tearing strength of not more than 10 units below the minimum requirement will be permitted for each wall, provided the variation is compensated for by a cross direction dry tensile strength test value in excess of the minimum requirement obtained from the tables in the ratio of 1 unit of dry tensile strength for each 5 units of tearing strength test below the minimum requirement; and variation in combined tearing strength of not more than 20 units below the minimum

requirement obtained from the tables will be permitted for each wall provided the variation is compensated for by a combined dry tensile strength test value in excess of the minimum requirement obtained from the tables in the ratio of 5 units of tearing strength for each unit of dry tensil strength below the minimum requirement.

§ 178.236-3 Construction. (a) Bags must be at least 4 thicknesses of paper; this must be heavy duty shipping sack kraft paper, conforming to the requirements of § 178.236-2 paragraphs (a) and (b) or equivalent, with a minimum total basis weight of 200 pounds of paper (500 sheets, 24" × 36"). Outer sheet must be of water-resistant stock and at least 60 pounds basis weight, inner sheets not less than 40 pounds basis weight. Bags to be of "satchel bottom" construction; bottoms to be reinforced with a kraft paper patch at least 30 pounds basis weight. Other bottoms of equal efficiency are authorized.

(b) Or, bags must be at least 2 thicknesses of paper; this must be heavy duty shipping sack kraft paper, or equivalent, with a minimum total basis weight of 110 pounds (500 sheets, 24" × 36"), fastened together with waterproof composition reinforced with jute, sisal, cotton, or other yarn or cord imbedded in the composition and criss-crossed at intervals of not over ½", approximately, so as to give approximately the same tensile strength for both width and length. Bags to be of "satchel bottom" construction. Other bottoms of equal efficiency are authorized.

(c) Moistureproof barrier sheets of paper, if used, must meet the requirements of § 178.236-2(b) and shall be considered as one thickness of paper and shall be counted as 50 pounds basis weight (500 sheets, 24" × 36").

§ 178.236-4 Adhesive. (a) Moisture resistant adhesive must be used on all seams, joints, and bottom patch, if any.

§ 178.236-5 Closure. (a) For 4-ply bags: Inner (fourth) ply to be diamond folded loose; the third ply to be diamond folded and sifcated across all its overlapping folds; the two outer plies to be diamond folded, and cross sealed, front to back and side to side, with gummed tape extending at least 2 inches down sides of bag; sealing tape must be 4" wide, of No. 1 Kraft paper, 90 pounds basis weight (500 sheets, 24" × 36"), or equivalent, and having a Mullen or Cady test, of not less than 90 percent of basis weight. Other closures of equal efficiency are authorized.

(b) For all bags: Any closure for the top which is equal in efficiency to that of the bottom, is authorized.

§ 178.236-6 Tests for shipment. (a) Bags as prepared for shipment must be able to withstand four 4-foot drops, one on each end and one each on opposite sides, without sifting or rupture.

§ 178.236-7 Marking. (a) Marking on each bag with letters and figures at least ½" high in rectangle as follows:

DOT-44B

(b) Each bag must also be marked with the name and address or symbol of the person making the mark specified in paragraph (a) of this section and be located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

§ 178.237 Specification 44C; multiwall paper bags.

§ 178.237-1 Compliance. (a) Required in all details.

§ 178.237-2 Paper. (a) Shipping sack kraft paper, plain, or extensible plain, shall conform to the average requirements specified in paragraphs (a)(1) or (a)(2) of this section.

(1) Shipping sack, kraft paper, plain:[1]

Nominal basis weight (500 sheets, 24" × 36")[2]	Minimum average dry tearing strength		Minimum average dry tensile strength per inch width	
	M.D.[3]	Total M.D. plus C.D.[3]	C.D.[3]	Total C.D. plus M.D.[3]
Pounds	Grams	Grams	Pounds	Pounds
40	88	158	14	41
50	110	235	19	53
60	132	282	23	64
70	154	329	27	74

[1] Shipping sack kraft paper, plain, is paper that consists of all sulphate pulp and no other fiber, and which has not been treated by coloring, bleaching, creping, coating, spraying, laminating, or impregnating for special qualities. Paper shall have a degree of water resistance as secured by normal rosin sizing, and shall comply with the requirements in paragraph (a) (1) of this section.

[2] A tolerance of minus 10 percent of the basis weight of individual plies of plain shipping sack kraft paper will be permitted, an average tolerance of minus 5 percent will be permitted in the sum total basis weight of all plies in multi-wall constructions. Variations in excess of specified basis weights will not be considered a defect or deviation. The basis weight of paper means the basis weight as produced by the paper machine, not including finish subsequently applied, such as coating or printing.

[3] M.D. means machine direction. C.D. means cross direction.

(2) Shipping sack, extensible kraft paper, plain:[1]

Nominal basis weight (500 sheets, 24" × 36")[2]	Minimum dry tearing strength		Minimum tensile energy absorption, ft.lbs. per square foot of paper	
	M.D.[3]	Total M.D. plus C.D.[3]	C.D.[3,4]	Total C.D. plus M.D.[3,4]
Pounds	Grams	Grams		
40	88	158	4.5	14.0
50	110	235	5.6	17.0
60	132	282	7.0	20.0
70	154	329	8.0	23.0
80	176	376	9.0	26.0

[1] Extensible shipping sack kraft paper, plain, is paper that consists of all sulphate pulp and no other fiber, and which has not been treated by coloring, bleaching, creping, coating, spraying, laminating or impregnating for special qualities. Paper shall have a degree of water resistance as secured by normal rosin sizing, and shall comply with the requirements in paragraph (a) (2) of this section.

[2] A tolerance of minus 10 percent of the basis weight of individual plies of extensible shipping sack kraft paper will be permitted, an average tolerance of minus 5 percent will be permitted in the sum total basis weight of all plies in multi-wall constructions. Variations in excess of specified basis weights will not be considered a defect or deviation. The basis weight of paper means the basis weight as produced by the paper machine, not including finish subsequently applied, such as coating or printing.

[3] M.D. means machine direction. C.D. means cross direction.

[4] Variations in cross-direction tensile energy absorption of not more than 0.5 units below the minimum requirements will be permitted, provided the variations are compensated by an increase in the machine direction tearing strength in the ratio of twenty units of tearing strength to one unit of tensile energy absorption, and variations in total tensile energy absorption of not more than one unit below the minimum requirements will be permitted, provided the variations are compensated by an increase in the total tearing strength in the same ratio. Similarly, variations in machine direction tearing strength of not more than ten units below minimum requirements will be permitted, provided variations are compensated by an increase in cross-direction tensile energy absorption in the ratio of one unit of tensile energy absorption to twenty units of tearing strength, and variations in total tearing strength of not more than twenty units below the minimum requirements will be permitted, provided the variations are compensated by an increase in the total tensile energy absorption in the same ratio. Conformance with the requirements of table shall be established by comparing the sum of the basis weights and tests for all of the plies specified in the construction of the bag, with the sum of the specified basis weights and tests for the respective papers comprising the different plies. All requirements in this table are for a paper conditioned to a relative humidity of 50 percent at a temperature of 23 C (73 F).

(b) Asphalt laminated or polyethylene coated shipping sack kraft paper when used shall comply with the following requirements:

Type paper	Minimum average dry tearing strength		Minimum average dry tensile strength per inch width		Heat resistance hours at 150° F. without impairing function of sack	Maximum average water-vapor permeability from both sides at 50 percent R.H. and 73° F. g/m. 2 24 hours	
	M.D.	Total M.D. plus C.D.	C.D.	Total C.D. plus M.D.		Uncreased	Creased[1]
	Grams	Grams	Pounds	Pounds			
Asphalt laminated[2,4]	110	235	19	53	5	90	150
10PE-50 :50-10PE[3]	110	235	19	53	5	70	120
15PE-50 150-15PE[3]	110	235	19	53	5	45	75

[1] Creasing at 40 E.

[2] Asphalt laminated kraft paper when used as a wall in fabricated sacks, shall conform to the requirements of paragraph (b) of this section and shall consist of kraft paper, the total basis weight of the two paper plies not less than 50 pounds per ream (500 sheets, 24" × 36"), continuously and uniformly laminated together with an average of not less than 25 pounds of asphalt per ream (500 sheets, 24" × 36"). Tolerance of minus 5 percent will be allowed on individual components. The total basis weight of the finished combination shall not exceed 100 pounds per ream (500 sheets, 24" × 36"). An asphalt laminated kraft wall meeting these requirements may be substituted for a plain kraft wall of 50 pounds basis or less, provided it meets the specification.

[3] Polyethylene coated shipping sack kraft paper. The polyethylene-coated kraft paper when used as walls in fabricated sacks shall meet the heat resistance and water vapor permeability requirements as specified in the table. A tolerance of minus 10 percent will be allowed for the lot sample average coating weight of polyethylene on shipping sack kraft paper. Minimum samples for testing shall comprise not less than 3 specimens 16 square inches each selected representatively from each polyethylene coated wall of each sack in the lot sample. Where barrier sheets are based on extensible kraft the weight of the barrier material shall be in addition to the basis weight of the paper.

[4] Asphalt laminated extensible kraft paper must consist of two sheets of extensible kraft paper, the total basis weight of the paper in the finished combination being not less than 50 pounds per ream (24" × 36"—500) with neither sheet weighing less than 23 pounds continuously and uniformly laminated together, with an average of not less than 25 pounds of asphalt per ream (24" × 36"—500). In determining the basis weight and test conformance of bags containing an asphalt laminated extensible kraft wall, the asphalt laminated extensible kraft wall shall be treated as if it were a single extensible kraft wall or combination of walls of 10 pounds lower total paper basis weight than the sum of the nominal basis weight in the asphalt laminated wall, but in no case shall be treated as less than the equivalent of a 50 pounds basis weight wall.

(c) Laminating materials. Any laminant other than asphalt or other water-vapor barrier wall may be used provided they meet the requirements in paragraph (b) of this section.

(d) All values in paragraphs (a) and (b) of this section are for paper having a moisture content in equilibrium with an atmosphere having a relative humidity of 50 percent plus or minus 2 percent at a temperature of 73° F. plus or minus 3.5° F. following preconditioning of the test specimens to a moisture content between 3 and 5.5 percent by exposure to relatively dry air having a temperature no greater than 140° F.

(e) Conformance of sacks with paper strength requirements shall be established by comparing the sums of the test values for all the walls of the new and unused sack with the sums of the respective strength values specified in paragraphs (a) and (b) of this section for the respective papers specified for the different walls of the sack.

(f) Variation in cross direction dry tensile strength of not more than 2 units below the minimum requirement based on paragraphs (a) and (b) of this section will be permitted for each wall of the sack, provided the variation is compensated for by a machine direction tearing strength test value in excess of the minimum requirement obtained from the tables, in the ratio of 5 units of tearing strength for each unit of dry tensile strength test below the minimum requirement; and variation in combined dry tensile strength of not more than 4 units below the minimum requirement based on paragraphs (a) and (b) of this section will be permitted for each wall used provided the variation is compensated for by a combined tearing strength test value in excess of the minimum requirement obtained from the tables in the ratio of 5 units of combined tearing strength for each unit of dry tensile strength test below the minimum requirement. Similarly, variation in machine direction tearing strength of not more than 10 units below the minimum requirement will be permitted for each wall, provided the variation is compensated for by a cross direction dry tensile strength test value in excess of the minimum requirement obtained from the tables in the ratio of 1 unit of dry tensile strength for each 5 units of tearing strength test below the minimum requirement; and variation in combined tearing strength of not more than 20 units below the minimum requirement obtained from the tables will be permitted for each wall provided the variation is compensated for by a combined dry tensile strength test value in excess of the minimum requirement obtained from the tables in the ratio of 5 units of tearing strength for each unit of dry tensile strength below the minimum requirement.

§ 178.237-3 Construction. (a) Bags must be at least 4 thicknesses of paper unless otherwise specified in part 173 of this subchapter; this must be heavy duty shipping sack kraft paper conforming to the requirements of § 178.237-2 paragraphs (a) and (b), or equivalent, with a minimum total basis weight of 250 pounds of paper (500 sheets, 24" x 36"). Outer sheet must be of water resistant stock at least 60 pounds basis weight, inner sheets not less than 40 pounds basis weight. Bags to be of sewn, siftproof bottom construction. Other bottoms of equal efficiency authorized.

(b) Moistureproof barrier sheets of paper, if used, must meet the requirements of § 178.237-2(b) and shall be considered as one thickness of paper and shall be counted as 50 pounds basis weight (500 sheets, 24" x 36").

§ 178.237-4 Adhesive. (a) Moisture resistant adhesive must be used on all seams, joints, and bottom patch, if any.

§ 178.237-5 Closure. (a) For all bags: Any closure for the top which is equal in efficiency to that of the bottom, is authorized.

§ 178.237-6 Tests for shipment. (a) Bags as prepared for shipment must be able to withstand four 4-foot drops, one on each end and one each on opposite sides, without sifting or rupture.

§ 178.237-7 Marking. (a) On each bag with letters and figures at least ½ inch high in rectangle as follows:

DOT-44C

(b) Each bag must also be marked with the name and address or symbol of the person making the mark specified in paragraph (a) of this section and be located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

---

§ 178.238 Specification 44D; multiwall paper bags.

§ 178.238-1 Compliance. (a) Required in all details.

§ 178.238-2 Paper. (a) Shipping sack kraft paper, plain, or extensible plain shall conform to the average requirements specified in subparagraphs (a)(1) and (a)(2) of this paragraph.

(1) Shipping sack, kraft paper, plain:[1]

Nominal basis weight (500 sheets, 24" x 36")[2]	Minimum average dry tearing strength		Minimum average dry tensile strength per inch width	
	M.D.[3]	Total M.D. plus C.D.[3]	C.D.[3]	Total C.D. plus M.D.[3]
Pounds	Grams	Grams	Pounds	Pounds
40	88	189	14	41
50	110	235	19	53
60	132	282	23	64
70	154	329	27	76

[1] Shipping sack kraft paper, plain, is paper that consists of all sulphate pulp and no other fiber, and which has not been treated by coloring, bleaching, creping, coating, spraying, laminating or impregnating for special qualities. Paper shall have a degree of water resistance as secured by normal rosin sizing and shall comply with the requirements in paragraph (a) (1) of this section.

[2] A tolerance of minus 10 percent of the basis weight of individual plies of plain shipping sack kraft paper will be permitted, an average tolerance of minus 5 percent will be permitted in the sum total basis weight of all plies in multi wall constructions. Variations in excess of specified basis weights will not be considered a defect or deviation. The basis weight of paper means the basis weight as produced by the paper machine, not including finish subsequently applied, such as coating or printing.

[3] M.D. means machine direction. C.D. means cross direction.

[4] A bleached sulphate kraft outer wall of 70 pounds basis weight will be permitted provided the combined test values of all of the 5 walls of the completed multi wall sack are in conformance with paragraph (e) of this section and § 178.238-3.

(2) Shipping sack, extensible kraft paper, plain:[1]

Nominal basis weight (500 sheets, 24" x 36")[2]	Minimum dry tearing strength		Minimum tensile energy absorption, ft. lbs. per square foot of paper	
	M.D.[3]	Total M.D. plus C.D.[3]	C.D.[3,4]	Total C.D. plus M.D.[3,4]
Pounds	Grams	Grams		
40	88	158	4.5	14.0
50	110	235	5.6	17.0
60	132	282	7.0	20.0
70	154	329	8.0	23.0
80	176	376	9.0	26.0

[1] Extensible shipping sack kraft paper, plain, is paper that consists of all sulphate pulp and no other fiber, and which has not been treated by coloring, bleaching, creping, coating, spraying, laminating or impregnating for special qualities. Paper shall have a degree of water resistance as secured by normal rosin sizing and shall comply with the requirements in paragraph (a) (2) of this section.

[2] A tolerance of minus 10 percent of the basis weight of individual plies of extensible shipping sack kraft paper will be permitted, an average tolerance of minus 5 percent will be permitted in the sum total basis weight of all plies in multi wall constructions. Variations in excess of specified basis weights will not be considered a defect or deviation. The basis weight of paper means the basis weight as produced by the paper machine, not including finish subsequently applied, such as coating or printing.

[3] M.D. means machine direction. C.D. means cross direction.

[4] Variations in cross direction tensile energy absorption of not more than 0.5 units below the minimum requirements will be permitted, provided the variations are compensated by an increase in the machine direction tearing strength in the ratio of twenty units of tearing strength to one unit of tensile energy absorption, and variations in total tensile energy absorption of not more than one unit below the minimum requirements will be permitted, provided the variations are compensated by an increase in the total tearing strength in the same ratio. Similarly, variations in machine direction tearing strength of not more than ten units below minimum requirements will be permitted, provided variations are compensated by an increase in cross-direction tensile energy absorption in the ratio of one unit of tensile energy absorption to twenty units of tearing strength, and variations in total tearing strength of not more than twenty units below the minimum requirements will be permitted, provided the variations are compensated by an increase in the total tensile energy absorption in the same ratio. Conformance with the requirements of table shall be established by comparing the sum of the basis weights and tests for all of the plies specified in the construction of the bag with the sum of the specified basis weights and tests for the respective papers comprising the different plies. All requirements in this table are for a paper conditioned to a relative humidity of 50 percent at a temperature of 23 C (73 F).

(b) Asphalt laminated or polyethylene coated shipping sack kraft paper when used shall comply with the following requirements:

Type paper	Minimum average dry tearing strength		Minimum average dry tensile strength per inch width		Heat resistance hours at 150° F. without impairing function of sack	Maximum average water-vapor permeability from both sides at 50 percent R.H. and 73° F. g/m. 2 24 hours	
	M.D.	Total M.D. plus C.D.	C.D.	Total C.D. plus M.D.		Uncreased	Creased[1]
	Grams	Grams	Pounds	Pounds			
Asphalt laminated[2,4]	110	235	19	53	5	9.0	15.0
10PE-50 150-10PE[3]	110	235	19	53	5	7.0	12.0
15PE-50 150-15PE[3]	110	235	19	53	5	4.5	7.5

[1] Creasing at 40 E.

[2] Asphalt laminated kraft paper when used as a wall in fabricated sacks, shall conform to the requirements of paragraph (b) of this section and shall consist of kraft paper, the total basis

weight of the two paper plies not less than 50 pounds per ream (500 sheets, 24" × 36"), continuously and uniformly laminated together with an average of not less than 25 pounds of asphalt per ream (500 sheets, 24" × 36"). Tolerance of minus 5 percent will be allowed on individual components. The total basis weight of the finished combination shall not exceed 100 pounds per ream (500 sheets, 24" × 36"). An asphalt laminated kraft wall meeting these requirements may be substituted for a plain kraft wall of 50 pounds basis or less, provided it meets the specification.

[3] Polyethylene coated shipping sack kraft paper. The polyethylene coated kraft paper when used as walls in fabricated sacks shall meet the heat resistance and water vapor permeability requirements as specified in the table. A tolerance of minus 10 percent will be allowed for the lot sample average coating weight of polyethylene on shipping sack kraft paper. Minimum samples for testing shall comprise not less than 3 specimens 16 square inches each selected representatively from each polyethylene coated wall of each sack in the lot sample. Where barrier sheets are based on extensible kraft the weight of the barrier material shall be in addition to the basis weight of the paper.

[4] Asphalt laminated extensible kraft paper must consist of two sheets of extensible kraft paper, the total basis weight of the paper in the finished combination being not less than 50 pounds per ream (24" × 36"—500) with neither sheet weighing less than 23 pounds continuously and uniformly laminated together, with an average of not less than 25 pounds of asphalt per ream (24" × 36"—500). In determining the basis weight and test conformance of bags containing an asphalt laminated extensible kraft wall, the asphalt laminated extensible kraft wall shall be treated as if it were a single extensible kraft wall or combination of walls of 10 pounds lower total paper basis weight than the sum of the nominal basis weight in the asphalt laminated wall, but in no case shall be treated as less than the equivalent of a 50 pounds basis weight wall.

(c) Laminating materials. Any laminant other than asphalt or other water-vapor barrier walls may be used provided they meet the strength requirements in paragraph (b) of this section.

(d) All values in paragraphs (a) and (b) of this section are for paper having a moisture content in equilibrium with an atmosphere having a relative humidity of 50 percent plus or minus 2 percent at a temperature of 73° F. plus or minus 3.5° F. following preconditioning of the test specimens to a moisture content between 3 and 5.5 percent by exposure to relatively dry air having a temperature no greater than 140° F.

(e) Conformance of sacks with paper strength requirements shall be established by comparing the sums of the test values for all the walls of the new and unused sack with the sums of the respective strength values specified in paragraphs (a) and (b) of this section for the respective papers specified for the different walls of the sack.

(1) Variation in cross direction dry tensile strength of not more than 2 units below the minimum requirement based on paragraphs (a) and (b) of this section will be permitted for each wall of the sack, provided the variation is compensated for by a machine direction tearing strength test value in excess of the minimum requirement obtained from the tables, in the ratio of 5 units of tearing strength for each unit of dry tensile strength test below the minimum requirement; and variation in combined dry tensile strength of not more than 4 units below the minimum requirement based on paragraphs (a) and (b) of this section will be permitted for each wall used provided the variation is compensated for by a combined tearing strength test value in excess of the minimum requirement obtained from the tables in the ratio of 5 units of combined tearing strength for each unit of dry tensile strength test below the minimum requirement. Similarly, variation in machine direction tearing strength of not more than 10 units below the minimum requirement will be permitted for each wall, provided the variation is compensated for by a cross direction dry tensile strength test value in excess of the minimum requirement obtained from the tables in the ratio of 1 unit of dry tensile strength for each 5 units of tearing strength test below the minimum requirement; and variation in combined tearing strength of not more than 20 units below the minimum requirement obtained from the tables will be permitted for each wall provided the variation is compensated for by a combined dry tensile strength test value in excess of the minimum requirement obtained from the tables in the ratio of 5 units of tearing strength for each unit of dry tensile strength below the minimum requirement.

§ 178.238–3 Construction. (a) Bags must be at least 5 thicknesses of paper; this must be heavy duty shipping sack kraft paper, conforming to the requirements of § 178.238–2 paragraphs (a) and (b), or equivalent, with a minimum total basis weight of 320 pounds of paper (500 sheets 24" × 36"). Outer sheet must be of water resistant stock and at least 70 pounds basis weight, inner sheets not less than 50 pounds basis weight. Bags to be of sewn, sift-proof bottom construction. Other bottoms of equal efficiency authorized.

Note 1: Exceptions to these construction requirements are authorized in §§ 173.367(a)(5) and 173.377(i).

(b) Moistureproof barrier sheets of paper, if used, must meet the strength requirements of § 178.238–2(b) and shall be counted as 50 pounds basis weight (500 sheets, 24 × 36 inches).

§ 178.238–4 Adhesive. (a) Moisture resistant adhesive must be used on all seams, joints, and bottom patch, if any.

§ 178.238–5 Closure. (a) For all bags: Any closure for the top which is equal in efficiency to that of the bottom, is authorized.

§ 178.238–6 Tests for shipment. (a) Bags as prepared for shipment must be able to withstand four 4-foot drops, one on each end and one each on opposite sides, without sifting or rupture.

§ 178.238–7 Marking. (a) On each bag with letters and figures at least ½ inch high in rectangle as follows:

DOT-44D

(b) Each bag must also be marked with the name and address or symbol of the person making the mark specified in paragraph (a) of this section and be located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

§ 178.239 Specification 44E; multiwall paper bags.

§ 178.239–1 Compliance. (a) Required in all details.

§ 178.239–2 Paper. (a) Shipping sack kraft paper, plain, or extensible plain, shall conform to the average requirements specified in paragraphs (a)(1) or (a)(2) of this section.

(1) Shipping sack, kraft paper, plain:[1]

Nominal basis weight (500 sheets, 24" × 36")[2]	Minimum average dry tearing strength		Minimum average dry tensile strength per inch width	
	M.D.[3]	Total M.D. plus C.D.[3]	C.D.[3]	Total C.D. plus M.D.[3]
Pounds	Grams	Grams	Pounds	Pounds
40	88	188	14	41
50	110	235	19	53
60	132	282	23	64
70	154	329	27	74

[1] Shipping sack kraft paper, plain, is paper that consists of all sulphate pulp and no other fiber, and which has not been treated by coloring, bleaching, creping, coating, spraying, laminating or impregnating for special qualities. Paper shall have a degree of water resistance as secured by normal rosin sizing and shall comply with the requirements in paragraph (a) (1) of this section.

[2] A tolerance of minus 10 percent of the basis weight of individual plies of plain shipping sack kraft paper will be permitted, an average tolerance of minus 5 percent will be permitted in the sum total basis weight of all plies in multiwall constructions. Variations in excess of specified basis weights will not be considered a defect or deviation. The basis weight of paper means the basis weight as produced by the paper machine, not including finish subsequently applied, such as coating or printing.

[3] M.D. means machine direction. C.D. means cross direction.

[4] A bleached sulphate extensible kraft outer sheet of not less than 50 pounds basis weight is authorized providing the combined test values of all the sheets of the bag are in conformance with paragraph (e) of this section and § 178.239–3.

(2) Shipping sack, extensible kraft paper, plain:[1]

Nominal basis weight (500 sheets, 24" × 36")[2]	Minimum dry tearing strength		Minimum tensile energy absorption, ft.-lbs. per square foot of paper	
	M.D.[3]	Total M.D. plus C.D.[3]	C.D.[3,4]	Total C.D. plus M.D.[3,4]
Pounds	Grams	Grams		
40	88	188	4.5	14.0
50	110	235	5.6	17.0
60	132	282	7.0	20.0
70	154	329	8.0	23.0
80	176	376	9.0	26.0

[1] Extensible shipping sack kraft paper, plain, is paper that consists of all sulphate pulp and no other fiber, and which has not been treated by coloring, bleaching, creping, coating, spraying, laminating or impregnating for special qualities. Paper shall have a degree of water resistance as secured by normal rosin sizing, and shall comply with the requirements in paragraph (a) (2) of this section.

[2] A tolerance of minus 10 percent of the basis weight of individual plies of extensible shipping sack kraft paper will be permitted, an average tolerance of minus 5 percent will be permitted in the sum total basis weight of all plies in multiwall constructions. Variations in excess of specified basis weights will not be considered a defect or deviation. The basis weight of paper means the basis weight as produced by the paper machine, not including finish subsequently applied, such as coating or printing.

[3] M.D. means machine direction. C.D. means cross direction.

[4] A bleached sulphate kraft outer sheet of not less than 50 pounds basis weight is authorized providing the combined test values of all the sheets of the bag in conformance with paragraph (e) of this section and § 178.239–3.

[5] Variations in cross-direction tensile energy absorption of not more than 0.5 units below the minimum requirements will be permitted, provided the variations are compensated by an increase in the machine-direction tearing strength in the ratio of twenty units of tearing strength to one unit of tensile energy absorption, and variations in total tensile energy absorption of not more than one unit below the minimum requirements will be permitted, provided the variations are compensated by an increase in the total tearing strength in the same ratio. Similarly, variations in machine-direction tearing strength of not more than ten units below minimum requirements will be permitted, provided variations are compensated by an increase in cross-direction tensile energy absorption in the ratio of one unit of tensile energy absorption to twenty units of tearing strength; and variations in total tearing strength of not more than twenty units below the minimum requirements will be permitted, provided the variations are compensated by an increase in the total tensile energy absorption in the same ratio. Conformance with the requirements of table shall be established by comparing the sum of the basis weights and tests for all of the plies specified in the construction of the bag, with the sum of the specified basis weights and tests for the respective papers comprising the different plies. All requirements in this table are for a paper conditioned to a relative humidity of 50 percent at a temperature of 23°C (73°F).

(b) Asphalt laminated or polyethylene coated shipping sack kraft paper when used shall comply with the following requirements:

Type paper	Minimum average dry tearing strength		Minimum average dry tensile strength per inch width		Heat resistance hours at 150° F. without impairing function of sack	Maximum average water-vapor permeability from both sides at 50 percent R.H. and 73° F. g/m. 24 hours	
	M.D.	Total M.D. plus C.D.	C.D.	Total C.D. plus M.D.		Uncreased	Creased[1]
	Grams	Grams	Pounds	Pounds			
Asphalt laminated[2 4]	110	235	19	53	5	90	150
10PE-50							
150-10PE[3]	110	235	19	53	5	70	120
15PE-50							
150-15PE[3]	110	235	19	53	5	45	75

[1] Creasing at 40° F.

[2] Asphalt laminated kraft paper when used as a wall in fabricated sacks, shall conform to the requirements of paragraph (b) of this section and shall consist of kraft paper, the total basis weight of the two paper plies not less than 50 pounds per ream (500 sheets, 24" × 36"), continuously and uniformly laminated together with an average of not less than 25 pounds of asphalt per ream (500 sheets, 24" × 36"). Tolerance of minus 5 percent will be allowed on individual components. The total basis weight of the finished combination shall not exceed 100 pounds per ream (500 sheets, 24" × 36"). An asphalt laminated kraft wall meeting these requirements may be substituted for a plain kraft wall of 50 pounds basis or less, provided it meets the specification.

[3] Polyethylene coated shipping sack kraft paper. The polyethylene coated kraft paper when used as walls in fabricated sacks shall meet the heat resistance and water vapor permeability requirements as specified in the table. A tolerance of minus 10 percent will be allowed for the lot sample average coating weight of polyethylene on shipping sack kraft paper. Minimum samples for testing shall comprise not less than 3 specimens 16 square inches each selected representatively from each polyethylene coated wall of each sack in the lot sample. Where barrier sheets are based on extensible kraft the weight of the barrier material shall be in addition to the basis weight of the paper.

[4] Asphalt laminated extensible kraft paper must consist of two sheets of extensible kraft paper, the total basis weight of the paper in the finished combination being not less than 50 pounds per ream (24" × 36"—500) with neither sheet weighing less than 23 pounds continuously and uniformly laminated together, with an average of not less than 25 pounds of asphalt per ream (24" × 36"—500). In determining the basis weight and test conformance of bags containing an asphalt laminated extensible kraft wall, the asphalt laminated extensible kraft wall shall be treated as if it were a single extensible kraft wall or combination of walls of 10 pounds lower total paper basis weight than the sum of the nominal basis weight in the asphalt laminated wall, but in no case shall be treated as less than the equivalent of a 50 pounds basis weight wall.

(c) **Laminating materials.** Any laminant other than asphalt or other water-vapor barrier walls may be used provided they meet the requirements in paragraph (b) of this section.

(d) All values in paragraphs (a) and (b) of this section are for paper having a moisture content in equilibrium with an atmosphere having a relative humidity of 50 percent plus or minus 2 percent at a temperature of 73° F. plus or minus 3.5° F. following preconditioning of the test specimens to a moisture content between 3 and 5.5 percent by exposure to relatively dry air having a temperature no greater than 140° F.

(e) Conformance of sacks with paper strength requirements shall be established by comparing the sums of the test values for all the walls of the new and unused sack with the sums of the respective strength values specified in paragraphs (a) and (b) of this section for the respective papers specified for the different walls of the sack.

(1) Variation in cross direction dry tensile strength of not more than 2 units below the minimum requirement based on paragraphs (a) and (b) of this section will be permitted for each wall of the sack, provided the variation is compensated for by a machine direction tearing strength test value in excess of the minimum requirement obtained from the tables, in the ratio of 5 units of tearing strength for each unit of dry tensile strength test below the minimum requirement; and variation in combined dry tensile strength of not more than 4 units below the minimum requirement based on paragraphs (a) and (b) of this section will be permitted for each wall used provided the variation is compensated for by a combined tearing strength test value in excess of the minimum requirement obtained from the tables in the ratio of 5 units of combined tearing strength for each unit of dry tensile strength test below the minimum requirement. Similarly, variation in machine direction tearing strength of not more than 10 units below the minimum requirement will be permitted for each wall, provided the variation is compensated for by a cross direction dry tensile strength test value in excess of the minimum requirement obtained from the tables in the ratio of 1 unit of dry tensile strength for each 5 units of tearing strength test below the minimum requirement; and variation in combined tearing strength of not more than 20 units below the minimum requirement obtained from the tables will be permitted for each wall provided the variation is compensated for by a combined dry tensile strength test value in excess of the minimum requirement obtained from the tables in the ratio of 5 units of tearing strength for each unit of dry tensile strength below the minimum requirement.

§ 178.239-3 Construction and capacity. (a) Bags must be at least 3 thicknesses of paper; this must be heavy duty shipping sack kraft paper conforming to the requirements of § 178.239-2 paragraphs (a) and (b), or equivalent, with a minimum total basis weight of 130 pounds of paper (500 sheets, 24" × 36"). Outer sheet must be of water-resistant stock and at least 50 pounds basis weight, inner sheets not less than 40 pounds basis weight. Bags to be of sewn and taped, cemented, taped, stachel bottom or other construction of equal efficiency to form a sift-proof and reasonably air-tight container. Authorized for not over 50 pounds net weight, except that bags having a minimum total basis weight of 160 pounds of paper (500 sheets, 24" × 36") with outer sheet of water-resistant stock and at least 60 pounds basis weight inner sheets not less than 50 pounds basis weight, are authorized for not to exceed 100 pounds net weight of contents.

(b) Moistureproof barrier sheets of paper, if used, must meet the requirements of § 178.239-2(b) and shall be considered as one thickness of paper and shall be counted as 50 pounds basis weight (500 sheets, 24" × 36").

§ 178.239-4 Adhesive. (a) Moisture resistant adhesive must be used on all seams, joints, and bottom patch, if any.

§ 178.239-5 Closure. (a) For all bags: Any closure for the top which is equal in efficiency to that of the bottom, is authorized.

§ 178.239-6 Tests for shipment. (a) Bags as prepared for shipment must be able to withstand four 4-foot drops, one on each end and one each on opposite sides, without sifting or rupture.

§ 178.239-7 Marking. (a) On each bag with letters and figures at least ½ inch high in rectangle as follows:

DOT-44E

(b) Each bag must also be marked with the name and address or symbol of the person making the mark specified in paragraph (a) of this section and be located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

---

§ 178.240 Specification 45B; bags, cloth and paper, lined.

§ 178.240-1 Compliance. (a) Required in all details.

§ 178.240-2 Capacity. (a) Not over 100 pounds net.

§ 178.240-3 Assembly. (a) Bags shall consist of cloth and paper parts all cemented together with curing rubber latex or asphalt, thus making a waterproofed bag as follows:

(1) Inside lining sheet.
(2) Cloth sheet.
(3) Intermediate sheet.
(4) Outside paper sheet.

§ 178.240-4 Inside lining sheet and intermediate sheet. (a) Inside lining sheet and intermediate sheet must be regenerated cellulose film at least 0.0012 inch thick or polyvinyl alcohol film at least 0.001 inch thick or other material of equal thickness and equivalent efficiency.

§ 178.240-5 Cloth sheet. (a) Cloth sheet must be burlap at least 8-ounce, 40-inch Calcutta A or B mill grade or Osnaburg cotton cloth at least 8½ ounces per square yard.

§ 178.240-6 Paper. (a) Paper must be shipping sack Kraft, creped, at least 45 pounds per ream (500 sheets 24" × 36") before creping.

§ 178.240-7 Latex and asphalt. (a) Latex and asphalt must be in sufficient quantity to form a secure bond between the parts of the bags.

§ 178.240-8 Seams. (a) Seams must be dust-tight and made by cementing or by sewing and taping with impregnated cloth tape to give seam strength at least equal to that of bag material and prevent sifting.

§ 178.240-9 Test. (a) The finished container, filled and closed as for shipment, must be capable of withstanding 2 drop tests of 6 feet on the butt and 2 drop tests of 6 feet on the side without sifting or rupture of burlap or liner.

§ 178.240-10 Marking. (a) Marking on each container by marks at least 1 inch high as follows:

(1) DOT-45B
(2) Name and address or symbol of person making the mark specified in paragraph (a)(1) of this section and located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

§ 178.240-11 Closing for shipment. (a) By sewing and taping with impregnated cloth tape to give seam strength at least equal to that of bag material and prevent sifting.

---

§ 178.241 Specification 44P; all-plastic bags.

§ 178.241-1 Compliance. (a) Required in all details.

§ 178.241-2 Plastic. (a) Plastic film shall be low density polyethylene having a melt index of 0.6 maximum, conforming to the minimum requirements specified in subparagraph (a)(1) of this section.

(1) Plastic film:

Nominal gauge (mils)[1]	Drop dart (grams)[2]	Pounds per sq. inch tensile[3]	Percent elongation[3]	Tear (Grams)[4]
5	210	2100	350	200
6	250	2100	350	240
7	295	2100	350	280
8	340	2100	350	350

[1] Gauge as measured by ASTM D 374-57T, tolerance ± 10 percent.

[2] Drop dart as measured by the drop dart method (ASTM D 1709-62T Method B). Under this method a polished steel dart having a diameter of 2 inches in the hemispherical head is suspended by an electro-magnet at a height sufficient to provide a drop of 60 inches to the surface of the test specimen. The test specimen must be placed over the bottom part of a two-piece annular clamp having an inside diameter of 5 inches, so as to be uniformly flat and free of folds. Test specimen must cover the clamp at all points. Not less than 10 specimens, not more than one drop per specimen, must be tested. If one half or more of the specimens tested resist failure the film shall be deemed to meet the requirements. Failure is defined as any break through the film.

[3] Tensile and percent elongation as measured by ASTM D 882-61T Method A.

[4] Tear as measured by ASTM D 1922-61T.

§ 178.241-3 Construction and capacity. (a) Bags must be constructed of plastic film conforming to the requirements of § 178.241-2. Bags having heat-sealed ends must be capable of withstanding static loads of 1¼ pounds per mil per inch of seal as measured in the following manner. Three one-inch wide samples must be cut from the top seal and three one-inch wide samples must be cut from the bottom seal of each bag to be tested. Samples must be cut perpendicular to the seal, one from the center of the seal and one each approximately 4 inches in each direction from the center of the seal. (The preferred method of cutting the samples is to place a one-inch wide die on the flat bag so that both film layers and the seal area can be cut simultaneously.) Samples must be cut of sufficient length to permit wrapping each film end around a ¼-inch diameter metal rod and to permit clamping each end one inch from heat seal. Clamp used (such as laboratory tubing clamp) must be one that will exert even pressure across a one-inch wide strip. Clamps must be carefully positioned on strips parallel to the heat seals. One clamp must be mounted to a support, permitting the sample strip to hang vertically, and a weight must be attached to the other clamp hanging free at the lower end of the assembly. The total weight exerted on the seal must be 1¼ pounds for each mil of gauge of the film. The test must be conducted at room temperature (approximately 73° F.). All samples tested must resist failure. Failure is defined as total seal separation occurring within 10 minutes after the test has begun. Other end closures of equal efficiency authorized. Bags of not less than 5 mil construction authorized for contents not to exceed 51 pounds net weight. Bags of not less than 7 mil construction authorized for contents not to exceed 81 pounds net weight.

§ 178.241-4 Tests for shipment. (a) Bags as prepared for shipment must be able to withstand six drops from a height of 4 feet onto a solid surface, one drop on each end, one drop on each face, and one drop on each side (edge), without sifting or rupture.

§ 178.241-5 Marking. (a) Each bag must be marked with letters and figures at least ½ inch high in rectangle as follows:

(1) DOT-44P.

(2) This marking shall be enclosed by a rectangle.

(b) Each bag must also be marked with the name and address or symbol of the person making the mark specified in paragraph (a) of this section and be located just above or below that mark. Symbol, if used, must be registered with the Director, OHMT.

SUBPART H

SPECIFICATIONS FOR PORTABLE TANKS

§ 178.245 Specification 51; steel portable tanks.

§ 178.245-1 Requirements for design and construction. (a) Tanks must be seamless or welded steel construction or combination of both and have a water capacity in excess of 1,000 pounds. Fusion welded tanks must be postweld heat treated and radiographed as prescribed in the ASME Code except that each tank constructed in accordance with Part UHT of the ASME Code must be postweld heat treated. Where postweld heat treatment is required, the tank must be treated as a unit after completion of all the welds in and to the shell and heads. The method must be as prescribed in the ASME Code. Welded attachments to pads may be made after postweld heat treatment is made. A tank used for anhydrous ammonia must be postweld heat treated. The postweld heat treatment must be as prescribed in the ASME Code, but in no event at less than 1050° F. tank metal temperature. Additionally, tanks constructed in accordance with Part UHT of the ASME Code must conform to the following requirements:

(1) Welding procedure and welder performance tests must be made annually in accordance with section IX of the ASME Code. In addition to the essential variables named therein the following must be considered to be essential variables: Number of passes, thickness of plate, heat input per pass, and manufacturer's identification of rod and flux. The number of passes, thickness of plate and heat input per pass may not vary more than 25 percent from the Procedure qualification. Records of the qualification must be retained for at least 5 years by the tank manufacturer and made available to duly identified representatives of the Department of Transportation or the owner of the tank.

(2) Impact tests must be made on a lot basis. A lot is defined as 100 tons or less of the same heat and having a thickness variation no greater than plus or minus 25 percent. The minimum impact required for full-sized specimens shall be 20 foot-pounds (or 10 foot-pounds for half-sized specimens) at 0° F. Charpy V-Notch in both the longitudinal and transverse direction. If the lot test does not pass this requirement, individual plates may be accepted if they individually meet this impact requirement.

(b) Except as noted below, all openings in the tank shall be grouped in one location, either at the top of the tank or at one end of the tank.

Exceptions: (1) The openings for liquid level gauging devices, or for safety devices, may be installed separately at the other location or in the side of the shell, (2) one plugged opening of 2-inch National Pipe Thread or less provided for maintenance purposes may be located elsewhere, (3) an opening of 3-inch National Pipe Size or less may be provided at another location, when necessary to facilitate installation of condensing coils.

(c) Each uninsulated tank used for the transportation of compressed gas, as defined in § 173.300 of this subchapter, must have an exterior surface finish that is significantly reflective such as a light reflecting color is painted, or a bright reflective metal or other material if unpainted.

§ 178.245-2 Material. (a) All material used for the construction of the tank and appurtenances shall be suitable for use with the commodity to be transported therein.

(b) A material of thickness less than 3/16 inch shall not be used for the shells and heads.

§ 178.245-3 Design pressure. (a) The design pressure of a tank authorized under this specification shall be not less than the vapor pressure of the commodity contained therein at 115° F., or as prescribed for a particular commodity by Part 173, except that in no case shall the design pressure of any container be less than 100 psig nor more than 500 psig. When corrosion factor is prescribed by these regulations, the wall thickness of the tank calculated in accordance with the "Code" (see § 178.245-1(a)) shall be increased by 20 percent or 0.10 inch, whichever is less.

Note 1: The term "design pressure" as used in this specification is identical to the term "maximum allowable working pressure" as used in the "Code" (see § 178.245-1(a)).

§ 178.245-4 Tank mountings. (a) Tanks shall be designed and fabricated with mountings to provide a secure base in transit. "Skids" or similar devices shall be deemed to comply with this requirement.

(b) All tank mountings such as skids, fastenings, brackets, cradles, lifting lugs, etc., intended to carry loadings shall be permanently secured to tanks in accordance with the requirements of the Code under which the tanks were fabricated and shall be designed to withstand static loadings in any direction equal to twice the weight of the tank and attachments when filled with the lading using a safety factor of not less than four, based on the ultimate strength of the material to be used. The specific gravity used in determining the static loadings shall be shown on the marking required by § 178.245-6(a) and on the report required by § 178.245-7(a).

(c) Lifting lugs or hold-down lugs may be added to either the tank or tank mountings. If lifting lugs and hold-down lugs are added directly to the tank, they shall be secured to doubling plates welded to the tank and located at points of support, except that lifting lugs or hold-down lugs

with integral bases serving as doubling plates may be welded directly to the tank. Each lifting lug and hold-down lug shall be designed to withstand static loadings in any direction equal to twice the weight of the tank and attachments when filled with the lading using a safety factor of not less than four, based on the ultimate strength of the material to be used.

(d) All tank mountings shall be designed so as to prevent the concentration of excessive loads on the tank shell.

§ 178.245-5 Protection of valves and accessories. (a) All valves, fittings, accessories, safety devices, gaging devices, and the like shall be adequately protected against mechanical damage.

(b) The protective device or housing shall comply with the requirements under which the tanks are fabricated with respect to design and construction, and shall be designed to withstand static loadings in any direction equal to twice the weight of the tank, and attachments when filled with the lading using a safety factor of not less than four, based on the ultimate strength of the material to be used.

(c) Requirements concerning types of valves, retesting, and qualification of portable tanks contained in §§ 173.32 and 173.315 must be observed.

§ 178.245-6 Name plate. (a) In addition to the markings required by the Code (see § 178.245-1(a)) under which tanks were constructed, they shall have permanently affixed, on one of the heads of the tank, a metal plate. This plate shall be permanently affixed by means of soldering, brazing, or welding around its complete perimeter. Neither the plate itself nor the means of attachment to the tank shall be subject to destructive attack by the contents of tank. Upon such plate shall be plainly marked by stamping, embossing, or other means of forming letters into or onto the metal plate itself the following information in characters at least ⅛ inch high:

Manufacturer's name ..... Serial No. .....
Owner's serial number .....
D O T. Specification number .....
Water capacity (pounds) .....
Tare weight (pounds) .....
Design pressure (psig) .....
Design specific gravity .....
Original test date .....
Tank retested at ..... (psig) on .....

(b) All tank outlets and inlets, except safety relief valves, shall be marked to designate whether they communicate with vapor or liquid when the tank is filled to the maximum permitted filling density.

§ 178.245-7 Report. (a) A copy of the manufacturer's data report required by the Code (see § 178.245-1(a)) under which the tank is fabricated shall be furnished to the owner for each new tank.

---

§ 178.251 General design and construction requirements applicable to specifications 56 (§ 178.252) and 57 portable tanks (§ 178.253).

§ 178.251-1 General requirements. (a) These specifications apply to tanks of any shape (cylindrical, conical, cubical, or other).

(b) The rated gross weight of the tank must not exceed the values used during the design qualification vibration and drop tests.

(c) Each tank must be in compliance with all applicable requirements of §§ 173.24 and 173.32 of this chapter.

§ 178.251-2 Materials of construction. (a) Except for gaskets, pressure relief devices, valve seats, liners, and linings, all construction material must be metal.

(b) Hardware for handling and securing, fitting protection, outlet piping, valves, relief devices, and closures must be made of material that is electrolytically compatible with, or suitably protected from electrolytic action when joined to the product retention components of the tank.

(c) Any material used must not be susceptible to stress corrosion cracking.

(d) Material specification: All sheet, plate, and extruded material for shell, heads, bulkheads, and baffles for portable tanks must meet the following minimum requirements:

(1) Aluminum alloys. Aluminum alloys must be suitable for fusion welding and must meet the following requirements:

Minimum yield strength ..... 24,000 p.s.i.
Minimum ultimate strength ..... 30,000 p.s.i.
Minimum elongation of standard 2 inch gage length ..... 8 percent

(2) Steel. Steel must meet the following requirements:

	Mild steel	Low alloy low carbon	Stainless
Minimum yield strength, p.s.i.	25,000	45,0000	25,000
Minimum ultimate strength, p.s.i.	45,000	60,0000	70,000
Minimum elongation of standard 2 inch gage length (percent)	20	25	30

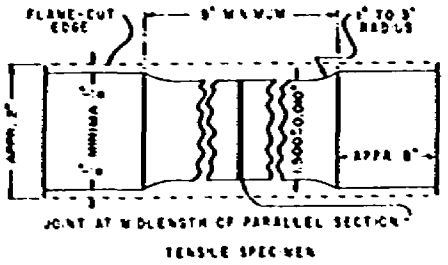
(3) Magnesium alloys. Magnesium alloy must conform to ASTM B-90-69, Grade ZE-10A.

§ 178.251-3 General construction requirements. (a) Method of joining. All joints between tank shells, heads, baffles (for baffle attaching rings), and bulkheads must be welded in accordance with the requirements of this section.

(b) Strength of joints (Aluminum Alloy (AL), Magnesium Alloy (MG)). All welded joints must be made in accordance with recognized good practice. The efficiency of a joint must not be less than 85 percent of the mechanical properties of the adjacent material. Each alloy must be joined by an inert gas arc welding process using filler metals which are consistent with material suppliers recommendations.

(c) Strength of joints (Mild Steel (MS), High Strength Low Alloy (HSLA), Austenitic Stainless Steel (SS)). Joints must be welded in accordance with recognized good practice. The efficiency of any joint must not be less than 85 percent of the mechanical properties of the adjacent material.

(d) Compliance test. Compliance with the requirements contained in paragraph (b) or (c) of this section for the welded joints must be determined by preparing two test specimens from materials and fabrication techniques representative of those to be used in each tank. Each specimen must be tested to failure under tension. Each test specimen must be prepared and tested in accordance with ASTM Standard E8-81 for metallic materials and ASTM Standard B557-81 for aluminum and magnesium-alloy products. As a minimum, one pair of representative test specimens, consisting of the minimum and maximum thickness for each type of material used may represent all the related tanks manufactured in the same shop within 12 months after the tests on the samples have been successfully completed. The butt welded specimens tested may be considered as qualifying other types or combinations of types of welds using the same filler material and welding process as long as parent metals are the same.



§ 178.251-4 Stacking, mounting, and tie-down provisions. (a) Load support devices. Each tank designed to be stacked in storage must be provided with load support devices. There may be no significant permanent deformation of the load support devices or the tank under either of the following stress conditions:

(1) Tanks loaded to their maximum authorized gross weight and stacked at least 18 feet high.

(2) A load on the support devices at least three times the maximum authorized gross weight of the tank.

(b) Base mounting. Each tank must be constructed with mountings to provide a secure base during transportation. The mounting may be in the form of a skid or similar structure.

(c) Tie-down system. If there are tie-down devices that are a structural part of the tank, the tie-down system must be capable of withstanding the following static loading without significant deformation to the tank. The static loading applied must have, with respect to the center of gravity of the tank a vertical component of at least two times the maximum authorized gross weight of the tank.

(1) If the design of the tank necessitates specific front and side orientation when loaded on a transportation vehicle, the static loading applied must have two horizontal components at right angles to each other, one direction at a time as follows:

(i) A longitudinal component at least seven times the maximum authorized gross weight of the tank in the direction of travel of the vehicle, and

(ii) A component of five times the maximum authorized gross weight of the tank in the transverse direction, or

(2) If the desing of the tank does not necessitate specific front and side orientation when loaded on a transportation vehicle, the static loading applied must have two horizontal components at right angles to each other, one direction at a time, of at least seven times the maximum authorized gross weight of the tank.

(d) If there is a structural part of the tank that could be used to tie the tank down and which is not in compliance with paragraph (c) of this section, it must be securely covered or locked during transportation to prevent its use as a tie-down.

§ 178.251-5 Testing. (a) **Design qualification testing.** Design qualification tests prescribed in this paragraph must be made on at least one of each design and size tank, except that a set of tests, when made on a tank of one size, may serve to qualify smaller tanks made of same kind and thickness of material, by the same fabrication technique, and with identical supports, and equivalent closures, and other appurtenances. Tests must be performed sequentially on a single tank in the order listed in this section. Additional tests must be made if there is any increase in design size of the tank, any reduction in thickness of material, or any change in material, or in fabrication technique. Test samples must be retained for 1 year.

(1) **Vibration and drop tests.** See applicable specification, §178 252-3(a) or §178 253-5(a).

(2) **Structural integrity tests.** (i) **Lifting devices.** If there is a system of lifting devices that is a structural part of the tank or is permanently attached thereto or to the support structure, the system must be capable of supporting at least three times the maximum gross weight of the tank, and each individual lifting device must be capable of supporting at least the maximum gross weight of the tank, without significant permanent deformation in either the lifting device system or in any part of the tank.

(ii) **Shipment support structure.** If the tank supports are a structural part of the tank, the supports must be capable of absorbing a force equal to the maximum gross weight of the tank or breaking without significant permanent deformation to the product retention component of the tank. The force must be applied to the supports at ground level from at least two horizontal directions at right angles to each other, one direction at a time.

(iii) **Stacking support devices.** If stacking support devices are a structural part of the tank, there must be no significant permanent deformation of any device or the tank under either of the following stress conditions:

(a) Tanks loaded to their maximum authorized gross weight and stacked at least 18 feet high.

(b) A load on the stacking support devices of at least three times the maximum authorized gross weight of the tank.

(iv) **Fittings and protective devices.** Each fitting (or its protective device) subject to this test requirement must be capable of withstanding a force at least two times the maximum authorized gross weight of the tank without resultant damage to the fitting. The force must be applied to the fitting or its protective device in at least two horizontal directions at right angles to each other, one direction at a time, and in alinement with the fitting.

(b) **Production quality control, testing and inspection.** See applicable specification, §178 252-3(b) or §178 253-5(b).

§ 178.251-6 Rejected tanks. No tanks which fail to pass any of the prescribed tests may be placed in service until suitable repairs have been made and satisfactory re-tests results have been obtained.

§ 178.251-7 Identification and marking. (a) A metal certification plate must be permanently affixed to each tank and must be readily accessible for inspection. The plate must be marked in letters and numerals at least ⅛-inch high by stamping, embossing, or other means of forming letters into or onto the metal plate itself. The marking must contain at least the following information:

Tank manufacturer	
Specification identification: Spec 56 or Spec 57	
Design pressure (for specification 57 only)	p.s.i.g.
Test pressure (for specification 56 only)	p.s.i.g.
Serial number	
Original test date	
Tare weight	lbs.
Rated gross weight[1]	lbs.
Volumetric capacity	U.S. gal (or cu. ft.)
Material's of construction[2]	

[1] The rated (permitted) gross weight may not exceed that weight used during the design qualification tests involving vibration and drop.

[2] E.g., AL for aluminum, MG for magnesium alloy, MS for mild steel, HSLA for high strength low alloy, SS for austenitic stainless steel, including ASTM or ASME reference.

(b) Unless the tank has been designed for stacking and meets the appropriate stacking integrity requirements of this specification, it must also be marked in letters at least 2 inches high in contrasting colors "Do Not Stack" and "Do Not Place Other Freight On Top Of This Tank", on at least two sides of the tank. These instructions must also appear on the certification plate. Plate markings are required to meet the requirements of paragraph (a) of this section and need not be in contrasting color.

---

§ 178.252 Specification 56; metal portable tank.

§ 178.252-1 General requirements. (a) Each tank must be in compliance with the general design and construction requirements in §178 251 in addition to the specific requirements of this section.

(b) Each tank may not exceed a rated gross weight of 7,700 pounds.

§ 178.252-2 Openings. (a) Each fill and discharge opening must be equipped with a closure and locking device.

(b) A drum-type locking ring closure is authorized for openings not exceeding 23 inches in diameter. A drum-type locking ring closure must be at least a 12-gage bolted ring with forged lugs having at least a ⅝-inch steel bolt tapped into one of the lugs. The locking ring must be equipped with a lock nut or equivalent device.

(c) For a tank that incorporates a hopper-type product discharge opening, the closure device must be constructed to retain product under the test conditions outlined in §§178 251-5 and 178 252-3(a). Closures for those openings must be designed with positive mechanical locking and sealing devices to prevent leakage during normal conditions incident to transportation.

§ 178.252-3 Testing. (a) **Design qualification testing.** In addition to the testing prescribed in §178 251-5(a), a vibration and a drop test are also required on each design. For these tests, the tank must be filled with a fine, dry powered material having a density that results in the tank having a gross weight not less than the rated gross weight of the tank.

(1) **Vibration test.** This test must be performed for 1 hour using a minimum double amplitude of 1 inch at a frequency that causes the test tank to be raised from the floor of the testing table so a piece of flat steel strap may be passed between the tank and the table. The tank must be restrained so that all horizontal motion is restricted and only vertical motion is permitted.

(2) **Drop test.** The tank must be capable of withstanding without leakage of contents a 2-foot free drop onto a flat unyielding horizontal surface, striking the target surface in the position and attitude from which maximum damage to the tank (including closures) is expected.

(b) **Production quality control, testing, and inspection.** (1) **Leakage test.** Each tank must be tested by a minimum air or hydrostatic pressure of at least 2 pounds per square inch gage applied to the entire tank. If the air pressure is used, the entire surface of all joints under pressure must be coated with, or immersed in, a solution of soap and water, or other material suitable for the purpose of detecting leaks. If the hydrostatic pressure test is used it must be carried out by using water or other liquid having a similar viscosity, the temperature of which may not exceed 100° F. and all joints under pressure must be inspected for leaks. For either test, the pressure must be held for a period of time sufficiently long to assure detection of leaks. All closures must be in place during the test. Any tank that has detectable leakage or significant permanent deformation does not meet the requirements of this specification.

---

§ 178.253 Specification 57; metal portable tank.

§ 178.253-1 General requirements. (a) Each tank must be in compliance with the general design and construction requirements in §178 251 in addition to the specific requirements of this section.

(b) Each tank must have a capacity of at least 110 gallons but not more than 660 gallons.

§ 178.253-2 Openings. (a) Each fill and discharge opening must be equipped with a closure device that meets the following requirements:

(1) Any closure for a fill opening in excess of 20 square inches must be equipped with a device to prevent the closure from fully opening without first relieving internal pressure.

(2) Any product discharge valve, if used, must be provided with a leak tight device, such as a cap or plug.

(3) Each closure must be vapor tight.

(b) A drum-type locking ring closure is authorized for any opening less than 23 inches in diameter. A drum-type locking ring closure must be at least a 12-gage bolted ring with forged lugs having at least a ⅝-inch steel bolt tapped into one of the lugs. The locking ring must be equipped with a lock nut or equivalent device.

§ 178.253-3 Protection of fittings. Each fitting which could be damaged sufficiently to result in leakage of tank contents must be protected by suitable guards or protective housings. The term "fitting" includes valves, closure devices, safety relief devices, and other accessories through which contents could leak from the tank. Each fitting or fitting protection device must be capable of withstanding the fitting protection test specified in §178 251-5.

§ 178.253-4 Vents. (a) Each tank must be equipped with at least one pressure relief device such as a spring-loaded valve, frangible disc or fusible plug.

(b) Each pressure relief device must communicate with the vapor space of the tank when the tank is in a normal transportation attitude. Shutoff valves must not be installed between the tank opening and any pressure relief device. Pressure relief devices must be mounted, shielded, or drained to prevent the accumulation of any material that could impair the operation or discharge capability of the device.

(c) The total emergency venting capacity (cu. ft./hr.) of each portable tank must be at least that determined from the following table.

Total surface area square feet[1][2]:	Cubic feet free air per hour
20	15,800
30	23,700
40	31,600
50	39,500
60	47,400
70	55,300
80	63,300
90	71,200
100	79,100
120	94,900
140	110,700
160	126,500

[1] Interpolate for intermediate sizes.
[2] Surface area excludes area of legs.

(1) The pressure operated relief device must open at not less than 3 pounds per square inch gage and at not over the design test pressure of the tank. The minimum venting capacity for pressure activated vents must be 6,000 cubic feet of free air per hour (measured at 14.7 p s i a. and 60° F) at not more than 5 pounds per square inch gage.

(2) If a frangible device is used for relieving pressure, the device must have a minimum area of 1.25 square inches and must be rated at less than the design test pressure of the tank.

(3) If a fusible device is used for relieving pressure, the device must have a minimum area of 1.25 square inches. The device must function at a temperature between 220° F. and 300° F. and at a pressure less than the design test pressure of the tank, unless this latter function is accomplished by a separate device.

(d) No relief device may be used which would release flammable vapors under normal conditions of transportation (temperature up to and including 130° F.).

§ 178.253-5 Testing.

(a) Design qualification testing. In addition to the testing prescribed in § 178.251-5, a vibration test, a drop test, and a pressure test are also required on each design. For the vibration and drop tests, the tank must be filled with a liquid to not less than the rated gross weight.

(1) Vibration test. This test must be performed for 1 hour using a minimum double amplitude of 1 inch at a frequency that causes the test tank to be raised from the floor of the testing table so a piece of flat steel strap may be passed between the tank and the table. The tank must be restrained so that all horizontal motion is restricted and only vertical motion is permitted.

(2) Drop test. The tank must be capable of withstanding without leakage of contents a 2-foot free drop onto a flat unyielding horizontal surface, striking the target surface in the position and attitude from which maximum damage to the tank (including piping and fittings) is expected.

(3) Pressure test. The tank must be capable of maintaining, under hydrostatic test for at least 5 minutes, at least one and one-half times the design pressure prescribed in this paragraph, without detectable leakage or significant permanent deformation. The pressure must be measured at the top of the tank. Each closure must be in place and blocked if necessary as for shipment. Each closure must be standard, except that tapping for pressurizing and gaging is permitted. Design pressure must be determined as follows:

$$P = \frac{hd}{115} + 3$$

Where:

P = Design pressure in psig;
h = Inside height of tank in inches;
d = Maximum allowable density in pounds per gallon;
115 = Number of cubic inches in 1 gallon (231) divided by a safety factor of two.

(b) **Production quality control, testing and inspection.** (1) **Leakage test.** Each tank must be leak tested by a minimum sustained air pressure of at least three pounds per square inch gage applied to the entire tank. The entire surface of all joints under pressure must be coated with or immersed in a solution of soap and water or other material suitable for the purpose of detecting leaks. The pressure must be held for a period of time sufficiently long to assure detection of leaks. All closures must be in place during the test, but safety relief devices may be removed and such openings plugged. Any tank that has detectable leakage or significant permanent deformation does not meet the requirements of this specification.

---

§ 178.255 Specification 60; steel portable tanks.

§ 178.255-1 General requirements. (a) Tanks must be of fusion welded construction, cylindrical in shape with seamless heads concave to the pressure. Tank shells may be of seamless construction.

(b) Tanks must be designed and constructed in accordance with and fulfill all the requirements of the ASME Code.

(c) Tanks including all permanent attachments must be postweld heat treated as a unit.

(d) Requirements concerning types of valves, retesting, and qualification of portable tanks contained in §§ 173.32 and 173.315 must be observed.

§ 178.255-2 Material. (a) Material used in the tank must be steel of good weldable quality and conform with the requirements of the ASME Code.

(b) The minimum thickness of metal, exclusive of lining material, for shell and heads of tanks shall be as follows:

Tank capacity:	Minimum thickness (inch)
Not more than 1,200 gallons	1/4
Over 1,200 to 1,800 gallons	5/16
Over 1,800 gallons	3/8

§ 178.255-3 Expansion domes. (a) Expansion domes, if applied, must have a minimum capacity of one percent of the combined capacity of the tank and dome.

§ 178.255-4 Closures for manholes and domes. (a) The manhole cover shall be designed to provide a secure closure of the manhole. All covers, not hinged to the tanks shall be attached to the outside of the dome by at least ¼ inch chain or its equivalent. Closure shall be made tight against leakage of vapor and liquid by use of gaskets of suitable material.

§ 178.255-5 Bottom discharge outlets. (a) Bottom discharge outlets prohibited, except on tanks used for shipments of sludge acid and alkaline corrosive liquids.

(b) If installed, bottom outlets or bottom washout chambers shall be of metal not subject to rapid deterioration by the lading, and each shall be provided with a valve or plug at its upper end and liquid-tight closure at its lower end. Every such valve or plug shall be designed to insure against unseating due to stresses or shocks incident to transportation. Bottom outlets shall be adequately protected against handling damage and outlet equipment must not extend to within less than one inch of the bottom bearing surface of the skids or tank mounting.

§ 178.255-6 Loading and unloading accessories. (a) When installed, gauging, loading and air inlet devices, including their valves, shall be provided with adequate means for their secure closure; and means shall also be provided for the closing of pipe connections of valves.

(b) Interior heater coils, if installed, must be extra heavy pipe and so constructed that breaking off of exterior connections will not cause leakage of tanks.

§ 178.255-7 Protection of valves and accessories. (a) All valves, fittings, accessories, safety devices, gauging devices, and the like shall be adequately protected against mechanical damage by a housing closed with a cover plate.

(b) Protective housing shall comply with the requirements under which the tanks are fabricated with respect to design and construction, and shall be designed with a minimum factor of safety of four to withstand loadings in any direction equal to two times the weight of the tank and attachments when filled with water.

§ 178.255-8 Safety devices. (a) See §173.315(i) of this subchapter.

§ 178.255-9 Compartments. (a) When the interior of the tank is divided into compartments, each compartment shall be designed, constructed and tested as a separate tank. Thickness of shell and compartment heads shall be determined on the basis of total tank capacity.

§ 178.255-10 Lining. (a) If a lining is required, the material used for lining the tank shall be homogeneous, nonporous, imperforate when applied, not less elastic than the metal of the tank proper. It shall be of substantially uniform thickness, not less than 1/32 inch thick if metallic, and not less than 1/16 inch thick if nonmetallic, and shall be directly bonded or attached by other equally satisfactory means. Rubber lining shall be not less than 1/16 inch thick. Joints and seams in the lining shall be made by fusing the material together or by other equally satisfactory means. The interior of the tank shall be free from scale, oxidation, moisture and all foreign matter during the lining operation.

§ 178.255-11 Tank mountings. (a) Tanks shall be designed and fabricated with mountings to provide a secure base in transit. "Skids" or similar devices shall be deemed to comply with this requirement.

(b) All tank mountings such as skids, fastenings, brackets, cradles, lifting lugs, etc., intended to carry loadings shall be permanently secured to tanks in accordance with the requirements under which the tanks are fabricated, and shall be designed with a factor of safety of four, and built to withstand loadings in any direction equal to two times the weight of the tanks and attachments when filled to the maximum permissible loaded weight.

(c) Lifting lugs or side hold down lugs shall be provided on the tank mountings in manner suitable for attaching lifting gear and hold-down

devices. Lifting lugs and hold-down lugs welded directly to the tank shall be of the pad eye type. Doubling plates welded to the tank and located at the points of support shall be deemed to comply with this requirement.

(d) All tank mountings shall be so designed as to prevent the concentration of excessive loads on the tank shell.

§ 178.255-12 Pressure test. (a) Each completed portable tank prior to application of lining shall be tested before being put into transportation service by completely filling the tank with water or other liquid having a similar viscosity, the temperature of which shall not exceed 100° F. during the test, and applying a pressure of 60 pounds per square inch gauge. The tank shall be capable of holding the prescribed pressure for at least 10 minutes without leakage, evidence of impending failure, or failure. All closures shall be in place while the test is made and the pressure shall be gauged at the top of the tank. Safety devices and/or vents shall be plugged during this test.

§ 178.255-13 Repair of tanks. (a) Tanks failing to meet the test may be repaired and retested, provided that repairs are made in complete compliance with the requirements of this specification.

§ 178.255-14 Marking. (a) In addition to marking required by the American Society of Mechanical Engineers Code, every tank shall bear permanent marks at least ¼ inch high stamped into the metal near the center of one of the tank heads or stamped into a plate permanently attached to the tank by means of brazing or welding or other suitable means as follows:

Manufacturer's name ..... Serial No .....
DOT specification .....
Nominal capacity ..... (gallons)
Tare weight ..... (pounds)
Date of manufacture .....

§ 178.255-15 Report. (a) A copy of the manufacturer's data report required by the Code (see § 178.245-1(a)) under which the tank is fabricated must be furnished to the owner for each new tank.

Place .....

§ 178.270 Specification IM 101 and IM 102; steel portable tanks; general design and construction requirements.

§ 178.270-1 Specification requirements for IM 101 and IM 102 steel portable tanks. (a) Each IM portable tank must meet the requirements of this section in addition to the requirements of § 178.271 (IM 101) or § 178.272 (IM 102). These requirements apply to IM portable tanks of diameters no greater than 2438 mm (96 inches) that are designed to carry liquids having a vapor pressure of less than 2.97 bar absolute (43 psia) at a temperature of 50°C. (122°F).

§ 178.270-2 General. (a) Each tank, including attachments and service and structural equipment, must be designed to withstand, without loss of contents, the maximum internal pressure that can be anticipated to result from the contents and the static and dynamic stresses incurred in normal handling and transportation.

(b) For the purpose of this subchapter and the IM tank table "maximum allowable working pressure" or MAWP is the maximum pressure that an IM portable tank may experience during any normal operation (including loading and unloading). The only exception to this limitation is hydrostatic testing.

(c) Each portable tank must have a cross-sectional design that is capable of being stress analyzed either mathematically or by the experimental method contained in UG-101 of the ASME Code, or other method acceptable to the Director, OHMT.

(d) Each portable tank must be designed so that the center of gravity of the filled tank is approximately centered within the points of attachment for lifting devices.

(e) When credit is taken for insulation to reduce the required emergency venting capacity of safety relief devices, the insulation must be jacketed or otherwise protected from the accumulation of moisture or foreign matter that would decrease its efficiency or corrode the tank.

(f) Each portable tank that has a lining must have a lining material that meets the following requirements:

(1) The material used to line the tank must be—
(i) Substantially immune to attack by the hazardous material transported;
(ii) Homogeneous;
(iii) Nonporous;
(iv) Imperforated when applied;
(v) At least as elastic as the material of the tank shell; and
(vi) Have thermal expansion characteristics compatible with the tank shell.

(2) The lining of the tank, tank fitting and piping must be—
(i) Attached by bonding or other satisfactory means;
(ii) Continuous; and
(iii) Extended around the face of any flange.

(3) Joints and seams in the lining must be made by fusing the material together or by other equally effective means.

§ 178.270-3 Materials of construction. (a) Each portable tank must be constructed of carbon or alloy steels. Materials included in Part UHT of the ASME Code or equivalent materials are not authorized. Any materials used in the tank shell must conform to a recognized national standard and must be suitable for the external environments in which the tank will be carried. The minimum elongation for any material must be 20 percent or greater.

(b) The maximum stress allowed for a material shall be determined using one of the following methods:

(1) 1.5 times the specified values for the material at 93°C (200°F) in Section VIII, Division 1 of the ASME Code;

(2) Derived by test for the actual yield and tensile strengths at 93°C (200°F) for the actual group of plates used to fabricate the tank using the methods described in § 178.270-3(d); or

(3) Derived from the minimum yield and tensile strengths at 93°C (200°F) specified by the national standard to which the material is manufactured using the methods described in § 178.270-3(d).

(c) Maximum allowable stress values, derived for an actual group of plates, that are based on actual tensile and yield strengths of the material at 93° C. (200°F) shall not be greater than 120 percent of the specified minimum yield and tensile strength specified in the national standard to which the material is manufactured.

(d) The maximum allowable stress values must be derived from the following criteria:

(1) For austenitic steels,
(i) When the yield strength is determined using the 0.2 percent offset, 93.75 percent of the yield strength.
(ii) When the yield strength is determined using the 1.0 percent offset, 75 percent of the yield strength.

(2) For carbon and low alloy steels, the yield strength is determined using the 0.2 percent offset. The maximum allowable stress value is the lower of 93.75 percent of the yield strength or 37.5 percent of the tensile strength.

(e) For purposes of these specifications, tensile strength, yield strength and elongation must be determined using a specimen having a gauge length:

$$L_o = 5.65(S_o)^{1/2}$$

where:

L_o = the gauge length of the specimen—millimeters (inches); and
S_o = the cross sectional area of the specimen—square millimeters (square inches).

Tensile tests and analysis of results must be in accordance with "ISO 82-1974(e) Steels-Tensile Testing." The yield strength in tension shall be the stress corresponding to a permanent strain of 0.2 percent of the guage length, except that for high alloy austenitic steels the yield strength shall be the stress corresponding to a permanent strain of 0.2 or 1.0 percent of the gauge length as appropriate. The elongation must be at least 20 percent.

(f) If maximum allowable stress values or minimum tank wall thicknesses are based on the actual yield strength, the actual tensile strength, or the actual elongation for the material used to fabricate the tank, the test records or certification of test results by the material producer or tank manufacturer must be approved by the approval agency, retained by the tank manufacturer for a period not less than 15 years, and made available to any duly identified representative of the Department or the owner of the tank.

§ 178.270-4 Structural integrity. (a) *Maximum stress values.* The maximum calculated stress value in a tank at the Test Pressure must be less than or equal to that specified for the material of construction at 93° C. (200 F) in § 178.270-3 of this part.

(b) *Tank shell loadings.* Tank shells, heads, and their fastenings shall be designed to prevent stresses in excess of two thirds those specified in § 178.270-3 of this part. The design calculations must include the forces imposed by each of the following loads:

(1) An internal pressure equal to the maximum allowable working pressure less 1 bar (14.5 psig) in combination with the simultaneously applied loadings of 3W vertically downward, 2W longitudinally, and 1W laterally acting through the center of the tank (W is the maximum permissible weight of the loaded tank and its attachments), and the requirements of paragraphs (b)(4), (5) and (6) of this section;

(2) An internal pressure equal to the maximum allowable working pressure less 1 bar (14.5 psig), in combination with the simultaneously applied loadings of 1W vertically upward, 2W longitudinally, and 1W laterally acting through the center of the tank (W is the maximum permissible weight of the loaded tank and its attachment), and the requirements of paragraphs (b)(4), (5) and (6) of this section;

(3) The load on the tank head resulting from an internal pressure equal to the maximum allowable working pressure, less 1 bar (14.5 psig), in combination with the dynamic pressure resulting from a longitudinal deceleration of 2 "g", and the requirements of paragraphs (b)(4), (5) and (6) of this section;

(4) Loads resulting from any discontinuities between tank shell and heads;

(5) Superimposed loads such as operating equipment, insulation, linings and piping; and

(6) Reactions of supporting lugs and saddles or other supports.

(c) The shell thickness used in calculating the resulting stress levels in a tank shall be exclusive of any corrosion allowance.

§ 178.270-5 Minimum thickness of shells and heads. (a) For the purposes of this section, mild steel is steel with a guaranteed minimum tensile strength of 37 deka newtons per square millimeter (53,650 p.s.i.) and a guaranteed elongation of 27 percent or greater.

(b) Except as otherwise provided in this subchapter, the shell and heads of each portable tank constructed of reference mild steel—

(1) With a maximum cross-sectional dimension of 1.8 meters (5.9 feet) or less, shall be at least 5mm (0.197 inches) thick; or,

(2) With a maximum cross-sectional dimension exceeding 1.8 meters (5.9 feet), shall be at least 6.35mm (0.250 inches) thick.

(c) The minimum thickness of the shell and heads of each portable tank constructed of a steel other than the reference mild steel, shall be obtained from the following formula:

Formula for metric units

$$e_1 = (10e_0)(Rm_1A_1)^{1/3}$$

Formula for nonmetric units

$$e_1 = (112.3e_0)(Rm_1A_1)^{1/3}$$

where:

e_0 = Required thickness of the reference steel from § 178.270-5(b)—millimeters (inches);
e_1 = Equivalent thickness of the steel used—millimeters (inches);
Rm_1 = Specified minimum tensile strength of the steel used—deka newtons per square millimeter (p.s.i.); and
A_1 = Specified minimum percentage elongation of the steel used—percent times 100 (i.e., if 20% use 20.0).

(d) When other than the standard minimum thickness for the reference mild steel is specified for a tank in the IM Tank Table, the specified minimum shell and head thickness must be at least equal to the larger of the thicknesses calculated from the formula given in § 178.270-5(c) and the following formula:

Formula for metric units

$$3_1 = (10e_0d_1)/1.8(Rm_1A_1)^{1/3}$$

Formula for nonmetric units

$$e_1 = (112.3e_0d_1)/5.9(Rm_1A_1)^{1/3}$$

where:

e_1 = Equivalent thickness of the steel used—millimeters (inches);
e_0 = The specified minimum shell and head thickness of the reference mild steel specified in the IM Tank Table—millimeters (inches);
d_1 = Actual outside diameter of the tank—meters (feet);
Rm_1 = Specified minimum tensile strength of the steel used—deka newtons per square millimeter (p.s.i.); and
A_1 = Specified minimum percentage elongation of the steel used—percent times 100 (i.e., if 20% use 20.0).

Note.—For paragraph (c) and (d) of this section the actual values for the tensile strength and percent elongation for the steel, as determined through tests on specimens from the group of plates to be used in the fabrication of the tank, may be substituted for the specified minimum values in the calculation prescribed in this paragraph (See § 178.270-3 of this part). Test records or certification of test results by the material producer or tank manufacturer must be retained by the tank manufacturer for a period not less than 15 years and must be made available to the Department or the owner of the tank.

§ 178.270-6 Tank supports, frameworks and lifting attachments. (a) Each portable tank must be constructed with a permanent support structure that provides a secure base in transport. Skids, frameworks, cradles, or similar devices are acceptable. The calculated stress in tank supports, frameworks, and lifting attachments must not exceed 60 percent of the specified minimum yield strength of the material of construction under the applicable loading conditions specified in § 178.270-4(b).

(b) An IM portable tank that meets the definition of "container" in § 450.3(a)(3) must meet the requirements of Parts 450 through 453 of this title, in addition to the requirements of this subchapter.

§ 178.270-7 Joints in tank shells. Joints in tank shells must be made by fusion welding. Such joints and their efficiencies must be as required by the ASME Code. Weld procedures and welder performance must be ASME Code qualified or must be qualified by the approval agency in accordance with the procedures in the ASME Code, Section IX, Welding and Brazing Qualifications. A record of each qualification must be retained by the manufacturer for the period prescribed in ASME Code, Section VIII, Pressure Vessels, and must be made available to any duly identified representative of the Department and the owner of the tank.

§ 178.270-8 Protection of valves and accessories. Each valve, fitting, accessory, safety device, gauging device, and other appurtenance shall be adequately protected against mechanical damage.

§ 178.270-9 Inspection openings. Each portable tank must be fitted with a manhole or other inspection opening sited above the maximum liquid level to allow for complete internal inspection and adequate access for maintenance and repair of the interior. Each portable tank with a capacity of more than 1893 liters (500 gallons) must be fitted with an elliptical or obround manhole at least 279 × 381 millimeters (11 × 15 inches), or 254 × 406 millimeters (10 × 16 inches), or with a circular manhole at least 381 millimeters (15 inches) in diameter. Any inspection opening and closure must be designed and reinforced as required by the ASME Code.

§ 178.270-10 External design pressure. (a) Each portable tank not fitted with vacuum relief devices must be designed to withstand a positive external pressure differential of at least 0.4 bar > (6 p.s.i.).

(b) Each portable tank fitted with vacuum relief devices must be designed to withstand a positive external pressure differential not less than the set pressure of the vacuum relief device and in any case at least 0.21 bar (3 p.s.i.).

§ 178.270-11 Pressure and vacuum relief devices. (a) *Relief devices required.* Each portable tank, or each independent compartment of a portable tank, must be fitted with pressure relief devices in accordance with the following:

(1) Each portable tank, or each independent compartment of a portable tank, with a capacity of more than 1893 liters (500 gallons), must be provided with a primary pressure relief device consisting of a spring-loaded pressure relief valve and, in addition, may have one or more emergency pressure relief devices that may be a spring-loaded pressure relief valve, a frangible disc or fusible element in parallel with the primary pressure relief device.

(2) Each portable tank, or each independent compartment of a portable tank, with a capacity of 1893 liters (500 gallons) or less, must be fitted with a primary pressure relief device that may either be a frangible disc or a spring-loaded pressure relief valve.

(3) If a frangible disc is inserted in series with required pressure relief valve, the space between the frangible disc and the pressure relief valve must be provided with a suitable tell-tale indicator to permit detection, prior to and during shipment, of disc rupture, pinholing, or leakage which could cause a malfunction of the pressure relief system. The frangible disc must rupture at a tank pressure within the range specified in § 178.270-11(c)(1).

(b) *Location and construction of relief devices.*

(1) Pressure relief devices must be spring-loaded valves, frangible discs, or fusible elements. Vacuum relief devices must be capable of reclosing in any attitude. Each pressure relief device inlet must be situated in the vapor space of the tank. The discharge from any device must be unrestricted and directed to prevent impingement upon the tank

shell or structural framework. Protective devices which deflect the flow of vapor are permissible provided the required vent capacity is maintained. Pressure and vacuum relief devices including their inlets must be sited on the top of the tank in a position as near as possible to the longitudinal and transverse center of the tank within the following limitation:

(i) Longitudinally on the tank within 1.07 m (3½ feet) or ⅛ the tank length, whichever is less, from the top center of the tank; and

(ii) Transversely within 12 degrees of the tank top.

(2) Except for a relief device installed in a piping system, each relief device must provide unrestricted venting under all conditions. Each pressure relief system, including any piping, must provide a venting capacity at least equal to the venting capacity specified in § 178.270-11(d) for the tank on which the system is installed.

(3) Fusible elements, when installed, must not be protected from direct communication with external heat sources.

(4) Spring-loaded pressure relief valves must be constructed in a manner to prevent unauthorized adjustment of the relief setting.

(c) *Pressure settings of relief devices.*—(1) *Primary pressure relief devices.* The primary relief device required by paragraph (a) of this section must be set to function in a range of no less than 100 percent and no greater than 125 percent of the maximum allowable working pressure (MAWP) for tanks having a MAWP below 44 psig. For tanks having a MAWP of 44 psig or greater, the primary pressure relief device must be set to function in a range of no less than 100 percent and no greater than 110 percent of the MAWP. Spring-loaded pressure relief valves must close after discharge at a pressure not less than 90 percent of the start-to-discharge pressure and remain closed at all lesser pressures.

(2) *Emergency pressure relief devices.* Each frangible disc, other than those used as a primary relief device in accordance with paragraph (b)(2) of this section, must be designed to burst at a pressure greater than 125 percent and less than or equal to 150 percent of the MAWP. Each spring loaded pressure relief valve used as an emergency pressure relief device must be set to operate at no less than 125 percent of the MAWP and be fully open at 150 percent of the MAWP.

(3) *Fusible elements.* Fusible elements must have a nominal yield temperature greater than the highest tank operating temperature and less than or equal to 121°C. (250°F). The pressure developed in the tank at the fusible element yield temperature must be below the test pressure of the tank.

(4) *Vacuum relief devices.* Vacuum relief devices, when used, must be designed to provide total containment of product under normal and accident conditions and must be set to open at a nominal external overpressure of not less than 0.21 bar (3 pounds per square inch) but not greater than the external pressure for which the tank is designed. Each vacuum relief device must have a minimum cross sectional flow area of 2.84 cm^2 (0.44 square inches).

(d) *Venting capacity of pressure relief devices.*—(1) *Pressure relief valves (spring-loaded).* Each pressure relief valve must have a minimum vent capacity of at least 170 standard cubic meters per hour (SCMH) (6,000 standard cubic feet per hour (SCFH)). The minimum total pressure relief valve vent capacity for each tank shall be 340 SCMH (12,000 SCFH) per 32.5 m^2 (350 square feet) of exposed tank area, but in any case at least 340 SCMH (12,000 SCFH).

(2) *Total tank vent capacity.* The total vent capacity of all pressure relief devices installed on each portable tank must be sufficient with all devices operating to limit the pressure in the tank or less than or equal to the test pressure. Except as provided in paragraph (d)(3) or (d)(4) of this section, the total vent capacity must be at least equal to that shown in the following Table:

Table I.—*Minimum total vent capacity*

[Metric units table in cubic meters of air per hour at atmospheric pressure and 15°C.]

Exposed area square meters	Cubic meters free air per hour	Exposed area square meters	Cubic meters free air per hour
2	841	37.5	9,306
3	1,172	40	9,810
4	1,455	42.5	10,308

200	184,000	900	621,000
225	199,000	950	656,000
250	213,500	1,000	686,000

Note.—Interpolate for intermediate sizes

(3) Notwithstanding the minimum total vent capacity shown in Table I, of paragraph (d)(2), a tank in dedicated service may have a lesser total vent capacity provided the approval certificate required by § 173.32a of this subchapter specifies the hazardous materials for which the tank is suitable. The lesser total vent capacity must be determined in accordance with the following formula:

Formula for metric units

$$Q = 5{,}660{,}000\ A^{0.82}(ZT)^{0.5}(LC)(M)^{0.5}$$

Formula for nonmetric units

$$Q = 37{,}980{,}000\ A^{0.82}(ZT)^{0.5}(LC)(M)^{0.5}$$

where:

Q = The total required venting capacity, in cubic meters of air per hour at standard conditions of 15.6°C. and 1 atm (cubic feet of air per hour at standard conditions of 60°F. and 14.7 psia);
T = The absolute temperature of the vapor at the venting conditions—degrees Kelvin (°C + 273) [degrees Rankine (°F + 460)];
A = The exposed surface area of tank shell—square meters (square feet);
L = The latent heat of vaporization of the lading—calories per gram (BTU/lb);
Z = The compressibility factor for the vapor (if this factor is unknown, let Z equal 1.0);
M = The molecular weight of vapor;
C = A constant derived from (K), the ratio of specific heats of the vapor. If (K) is unknown, let C = 315.

$$C = 520\sqrt{K\left(\frac{2}{K+1}\right)^{\frac{K+1}{K-1}}}$$

where:

K = C_p/C_v
C_p = The specific heat at constant pressure, in calories per gram degree centigrade (BTU/lb°F); and
C_v = The specific heat at constant volume, in calories per gram degree centigrade (BTU/lb°F).

(4) The required total venting capacity determined by using Table I or paragraph (d)(3) of this section may be reduced for insulated tanks to Q_i by the following formula:

$$Q_i = FQ$$

where:

Q = The total required venting capacity of the insulated tank;
Q_i = The total venting capacity required for an uninsulated tank according to Table I or paragraph (d)(3) of this section;
F = A coefficient with a value greater than or equal to 0.25 according to the following formula:

Formula for metric units

$$F = \frac{8U(649-t)}{93.5\times10^6}$$

Formula for nonmetric units

$$F = \frac{8U(1200-t)}{34{,}500}$$

where:

U = The thermal conductance of the insulation system taken at 38°C. (100°F.), in gram calories per hour sq. meter °C. (BTU per hour sq. feet °F); and
t = The actual temperature of the substance at loading, in °C. (°F).

(5) Insulation systems approved for this purpose must:
(i) Remain effective at all temperatures up to 649°C. (1200°F.); and
(ii) Be jacketed with a material having a melting point of 649°C. (1200°F.) or greater.

(6) The flow capacity rating of any pressure relief device must be certified by the manufacturer to be in accordance with the applicable provisions of the ASME Code with the following exceptions:
(i) The ASME Code stamp is not required; and
(ii) The flow capacity certification test for spring loaded pressure relief valves may be conducted at a pressure not to exceed 120% of the set pressure provided the stamped flow capacity rating is not greater than 83% of the average capacity of the valves tested.

(e) *Markings on pressure and vacuum relief devices.* The following information shall be plainly displayed on each pressure relief device:
(1) The pressure or, when appropriate, the temperature at which the device is set to function;
(2) Except for vacuum relief devices, the rated flow capacity of air discharged per minute at 15°C. (59°F) and atmospheric pressure, at;
(i) The set pressure for frangible discs;
(ii) No greater than 20% above the start to discharge pressure for spring-loaded relief devices; or,
(iii) The fusing temperature for fusible elements.
(3) The manufacturer's name and catalog number; and
(4) The allowable tolerances at the start to discharge pressure and the allowable tolerances at the discharge temperature.

§ 178.270-12 Valves, nozzles, piping, and gauging devices. (a) All tank nozzles, except for those provided for relief devices, thermometer wells, and inspection openings, must be fitted with manually operated stop valves located as near the shell as practicable either internal or external to the shell. A tank nozzle installed for a pressure relief device must not be provided with a stop valve that restricts the flow from the tank to the pressure relief device (see §178.270-11(b)(2)). A tank nozzle installed in the vapor space to provide a filling or cleaning opening, which is closed by a blank flange or other suitable means, need not be provided with a manually operated stop valve. A tank nozzle installed for a thermometer well or inspection opening need not be provided with a manually operated stop valve.

(b) Each valve must be designed and constructed to a rated pressure not less than the maximum allowable working pressure of the tank. Each stop valve with a screwed spindle must be closed by a clockwise motion of the handwheel. All valves must be constructed to prevent unintentional opening.

(c) Each internal discharge valve shall be self-closing, located inside the tank, within the welded flange or within its companion flange.

(d) A shear section must be located outboard of each internal discharge valve seat and within 10.2 cm (4 inches) of the vessel. The shear section must break under strain without affecting the product retention capabilities of the tank and any attachments.

(e) All piping must be of suitable material. Welded joints must be used wherever practicable. The bursting strength of all piping and pipe fittings must be at least 4 times the maximum allowable working pressure of the tank. Piping must be supported in such a manner as to prevent damage due to thermal stresses, jarring or vibration.

(f) All nozzles and tank shell penetrations for nozzles shall be designed and constructed in accordance with the ASME Code.

(g) Glass liquid level gauges, or gauges of other easily destructible material, which are in direct communication with the contents of the tank are prohibited.

§ 178.270-13 Testing. (a) *Hydrostatic test.* Each portable tank and all piping, valves, and other attachments which are subject to the pressure of the contents of the tank, except pressure relief devices, must be hydrostatically tested by completely filling the tank (including domes, if any) with water or other liquid having a similar density and viscosity and applying a pressure of at least 150 percent of the maximum allowable working pressure. The pressure shall be maintained for at least 10 minutes. While under pressure, the tank shall be inspected for leakage, undue distortion, or other conditions which indicate weakness or which might render the tank unsafe for transportation service. Failure to successfully meet the test criteria shall be deemed evidence of failure to meet the requirements of this specification. Tanks failing to pass the test shall be suitably repaired and must successfully pass the prescribed tests prior to use for transporting any hazardous material.

(b) *Testing of internal coils.* Internal coils, if installed, must be hydrostatically tested to an internal pressure of 13.8 bar (200 psig) or 150 percent of the rated pressure of the coils, whichever is greater.

(d) *Tank container qualification test.* For each tank design, a prototype tank, using a framework for containerized transport, must fulfill the requirements of Parts 450—453 of this title for compliance with the requirements of Annex II of the International Convention for Safe Containers. In addition, the following tests must be completed without leakage or deformation that would render the tank unsuitable for use:
(1) *Longitudinal inertia.* The tank loaded to its maximum gross weight must be positioned with its longitudinal axis vertical. It shall be held in this position for five minutes by support at the lower end of the base structure providing vertical and lateral restraint and by support at the upper end of the base structure providing lateral restraint only.
(2) *Lateral inertia.* The tank loaded to its maximum gross weight must be positioned for five minutes with its transverse axis vertical. It shall be held in this position for five minutes by support at the lower side of the base structure providing vertical and lateral restraint and by support at the upper side of the base structure providing lateral restraint only.

(d) *Approval of smaller tanks of the same design.* Design approval must include the prototype testing of at least one tank of each design and each size; however, a set of tests made on a tank of one size may serve for the approval of smaller tanks with equal or lesser diameter and length) made of the same material and thickness by the same fabrication technique and with identical supports and equivalent closures and other appurtenances.

(e) *Pressure and vacuum relief devices.* Each spring loaded relief device must be tested for the accuracy of the setting prior to installation on a tank and must be effectively sealed to maintain the required setting.

§ 178.270-14 Marking of tanks. (a) *General.* Each tank must bear a corrosion resistant metal identification plate that is permanently attached to the portable tank and readily accessible for inspection. The information required in paragraph (b), and, when appropriate, paragraph (c) of this section must be stamped, embossed or otherwise marked by an equally durable method on the plate in characters at least 3 mm (0.118 inches) high. The plate must not be painted.

(b) *Required information.* At least the following information must appear on the metal identification plate for each tank:
(1) US DOT Specification number.
(2) Country of manufacture.
(3) Manufacturer's name.
(4) Date of manufacture.
(5) Manufacturer's serial number.
(6) Identification of USA DOT approval agency and approval number.
(7) Maximum allowable working pressure, in bar or psig.
(8) Test pressure, in bar or psig.
(9) Total measured water capacity at 20°C. (68°F), in liters or gallons.
(10) Maximum allowable gross weight, in kg or lbs.
(11) Equivalent minimum shell thickness in mild steel, in mm or inches.
(12) Tank material and specification number.
(13) Metallurgical design temperature range, in °C. and °F.

(c) *Additional information.* The following additional information must appear on the metal identification plate when applicable:
(1) Lining material.
(2) Heating coil maximum allowable working pressure in bar and psig.
(3) Corrosion allowance, in mm or in.

(d) In addition to the markings required above, each tank used in international transport must have a Safety Approval Plate containing the information required in §§ 451.21 through 451.25 of this title.

(e) Nothing in this section shall be deemed to preclude the display of other pertinent information on the required metal identification plate.

---

§ 178.271 Specification IM 101; steel portable tanks.

§ 178.271-1 General requirements. (a) Specification IM 101 portable tanks must comply with the general design and construction requirements in §178.270 of this subpart in addition to the specific design requirements contained in this section.

(b) The maximum allowable working pressure of each tank shall be equal to or greater than 1.75 bar (25.4 psig) and less than 6.8 bar (100 psig).

(c) Each tank shall be designed and constructed in accordance with the requirements of Section VIII, Division 1, of the ASME Code except as limited or modified in this section or in §178.270 of this subpart. ASME certification or stamp is not required.

---

§ 178.272 Specification IM 102; steel portable tanks.

§ 178.272-1 General requirements. (a) Specification IM 102 portable tanks must comply with the general design and construction requirements in §178.270 of this subpart in addition to the specific design requirements contained in this section.

(b) The maximum allowable working pressure of each tank shall be less than 1.75 bar (25.4 psig) but at least 1.0 bar (14.5 psig).

(c) Each tank shall be designed and constructed in accordance with the requirements of Section VIII, Division 1, of the ASME Code except as limited or modified in this section or in §178.270 of this subpart. ASME certification or stamp is not required.

§ 178.272-2 Minimum thickness of shells and heads. (a) The approval agency may authorize a minimum thickness less than that required by §178.270-5 of this subpart where additional protection against tank puncture provides equal integrity.

(b) The shell and head thickness of a tank must be at least:
(1) 3.18 mm (0.125 inches) for a tank with a maximum cross-sectional dimension of 1.8 meters (5.9 feet) or less; or

(2) 4 mm (0.157 inches) for a tank constructed of the reference mild steel having a maximum cross-sectional dimension exceeding 1.8 meters (5.9 feet). For tanks having a maximum cross-sectional dimension exceeding 1.8 meters (5.9 feet) constructed of other steels, an equivalent head and shell thickness calculated in accordance with § 178.270-5(c) of this subpart may be used, subject to an absolute minimum of 3.18 mm (0.125 inches).

(c) The following additional puncture protection systems are authorized.

(1) An overall external structural protection, such as a jacket, which is rigidly secured to the tank with a layer of cushioning material installed between the external structural protection and the tank; or

(2) A complete framework surrounding the tank including both longitudinal and transverse structural members.

SUBPART J

SPECIFICATIONS FOR CONTAINERS FOR MOTOR VEHICLE TRANSPORTATION

§ 178.315 Specification MC 200; containers for liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate.

§ 178.315-1 Motor vehicle body. (a) Every motor vehicle used for the transportation of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate, other than desensitized liquid explosives, as defined in § 173.53(e), shall have a body constructed as set forth below, which body shall have component parts as specified hereinafter.

§ 178.315-2 Body proper. (a) The motor-vehicle body proper shall have a hinged cover. Both the body and the cover shall be well and strongly built of wood or other nonsparking material of equal strength, thoroughly waterproofed, having no end or side openings, and lined with copper or other nonsparking sheet metal having all seams made tight against leakage of nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate by welding, brazing, or soldering. No metal of such character as to be capable of producing a spark when struck may be exposed on the inside or the top of the body, nor on the nether side or any edge of the cover, the top of which shall be covered with metal. The body shall be of such dimensions that it will contain only a single tier of individual containers and of such approximate height that the felt pads will securely constrain all inside containers from vertical motion with respect to the body, and shall be securely and firmly attached to the chassis of the motor vehicle. The total load shall not exceed nine hundred (900) quarts liquid measure of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate.

§ 178.315-3 Cellular construction. (a) In the motor-vehicle body specified in § 178.315-2 shall be inserted suitable wooden or other nonmetallic, nonsparking cellular construction, the dimensions of each cell of which shall be such that the rubber "boot" or secondary container for the primary container of the nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate, both of which are specified hereinafter, shall snugly fit. The cellular construction shall extend from near the top to near the bottom of the full height of each "boot" to be fitted therein, and shall rest upon and be covered by at least one-half (½) inch of felt padding or other material affording equivalent shock-absorbing protection. The cellular construction shall be of such strength as to provide suitable restraint under all conditions of loading to prevent relative motion of inside containers to be inserted or carried therein.

§ 178.315-4 Inside containers and boots. (a) Inside containers. Individual containers shall be made of copper or other nonsparking metal of equivalent strength, with all seams closed by welding, brazing or soldering, and shall be tight against leakage of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate. No individual container shall exceed ten (10) quarts (liquid measure) capacity of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate.

(b) Boots, rubber containers for individual containers. Each individual container of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate shall be contained in a rubber boot or outer container into which it shall snugly fit, and which, in turn, shall snugly fit into any cell of the cellular construction specified in § 178.315-3. This boot shall be watertight throughout and at least of such volume as to contain all of the liquid content of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate of any inside container inserted in it. It shall be provided with V-shaped grooves at suitable spacings throughout its inside surface, extending from top to bottom in such manner as to prevent the entrapment of air therein upon insertion of the inside container of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate. The inside height of the rubber boot shall approximate the height of the insider container (including stopper) as shipped.

§ 178.315-5 Marking. Each container must be marked as prescribed in § 173.24 of this subchapter.

---

§ 178.318 Specification MC 201; container for detonators and percussion caps.

§ 178.318-1 Scope. (a) This specification pertains to a container to be used for the transportation of detonators and percussion caps in connection with the transportation of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate, where any or all of such types of caps may be used for the detonation of liquid nitroglycerin, desensitized liquid nitroglycerin or diethylene glycol dinitrate in blasting operations. This specification is not intended to take the place of any shipping or packing requirements of this Department where the caps in question are themselves articles of commerce.

§ 178.318-2 Container. (a) Every container for detonators and percussion caps coming within the scope of this specification shall be constructed entirely of hard rubber, phenolresinous or other resinous material, or other nonmetallic, nonsparking material, except that metal parts may be used in such locations as not in any event to come in contact with any of the caps. Space shall be provided so that each detonator of whatever nature may be inserted in an individual cell in the body of the container, into which each such cap shall snugly fit. There shall be provided no more than twenty (20) such cellular spaces. Space may be provided into which a plurality of percussion caps may be carried, provided that such space may be closed with a screw cap, and further provided that each or any such space is entirely separate from any space provided for any detonator. Each cellular space into which a detonator is to be inserted and carried shall be capable of being covered by a rotary cover so arranged as to expose not more than one cell at any time, and capable of rotation to such a place that all cells will be covered at the same time, at which place means shall be provided to lock the cover in place. Means shall be provided to lock in place the cover for the cells provided for the carrying of detonators. The requirement that not more than one cell be exposed at one time need not apply in the case of detonators, although spaces for such caps and blasting caps shall be separate. Sufficient annular space shall be provided inside the cover for such detonators that, when the cover is closed, there will be sufficient space to accommodate the wires customarily attached to such caps. If the material is of such nature as to require treatment to prevent the absorption of moisture, such treatment shall be applied as shall be necessary in order to provide against the penetration of water by permeation. A suitable carrying handle shall be provided, except for which handle no part of the container may project beyond the exterior of the body.

(b) Exhibited in plates I and II are line drawings of a container for detonators and percussion caps, illustrative of the requirements set forth in § 178.318-2(a). These plates shall not be construed as a part of this specification.

§ 178.318-3 Marking. Each container must be marked as prescribed in § 173.24 of this subchapter.

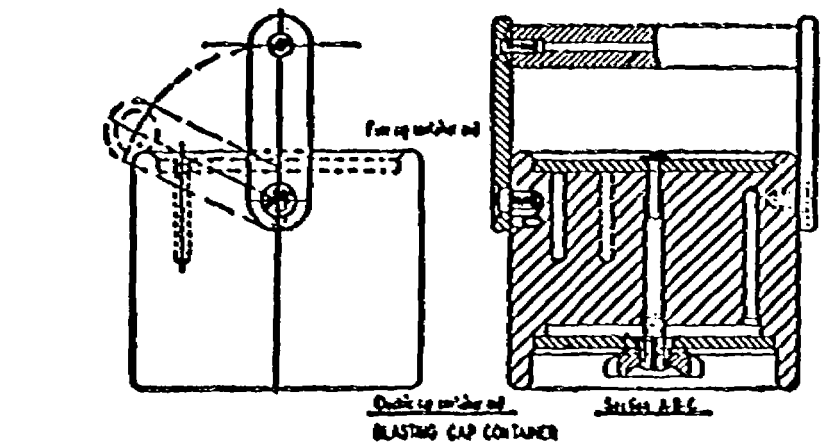
---

§ 178.337 Specification MC 331; cargo tanks constructed of steel, primarily for transportation of compressed gases as defined in the Compressed Gas Section.

§ 178.337-1 General requirements. (a) ASME Code construction. Tanks must be—(1) Seamless or welded construction or a combination of both; (2) Designed and constructed in accordance with the ASME Code.

(3) Made of steel or aluminum; however, if aluminum is used, the cargo tank must be insulated and the hazardous material to be transported must be compatible with the aluminum (see §§ 173.33(i), 173.315(a) Table Note 11, and 178.337-2(a)(1) of this subchapter); and

(4) Covered with a steel jacket if the cargo tank is insulated and used to transport a flammable gas (see § 173.315(a) Table Note 11 of this subchapter).



BLASTING CAP CONTAINER

PLATE I

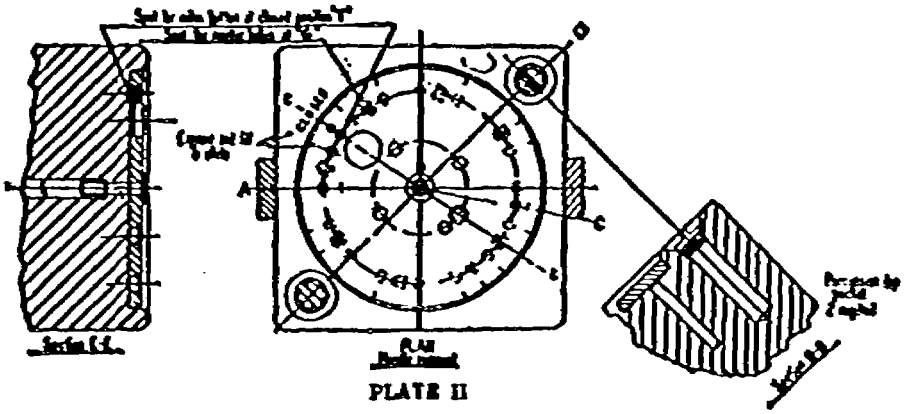


PLATE II

(b) **Design pressure.** The design pressure of a tank authorized under this specification shall be not less than the vapor pressure of the commodity contained therein at 115 degrees F or as prescribed for a particular commodity in § 173.315(a)(1), except that in no case shall the design pressure of any tank be less than 100 psig. nor more than 500 psig.

Note: The term "design pressure" as used in this specification, is identical to the term "maximum allowable working pressure" as used in the ASME Code.

(c) **Openings.** (1) Excess pressure relief valves shall be located in the top of the tank or heads.

(2) A chlorine tank shall have only one opening. That opening shall be in the top of the tank and shall be fitted with a nozzle that meets the following requirements:

(i) On a tank manufactured on or before December 31, 1974, the nozzle shall be protected by a dome cover plate which conforms to either the standard of The Chlorine Institute, Inc., Dwg. 103–3, dated January 23, 1958, or to the standard specified in paragraph (c)(2)(ii) of this section.

(ii) On a tank manufactured on or after January 1, 1975, the nozzle shall be protected by a manway cover which conforms to the standard of The Chlorine Institute, Inc., Dwg. 103–4, dated September 1, 1971.

(d) **Reflective design.** Every uninsulated tank permanently attached to a tank motor vehicle shall, unless it be covered with a jacket made of aluminum, stainless steel, or other bright nontarnishing metal, be painted a white, aluminum or similar reflecting color on the upper two-thirds of area of the tank.

(e) **Insulation.** Compliance with the requirements for use and performance of insulation is required (see §§ 173.33(i), 173.315(a) Table Note 11, and 178.337-1(a)(3) of this subchapter).

(f) **Postweld heat treatment.** Postweld heat treatment must be as prescribed in the ASME Code except that each tank constructed in accordance with Part UHT of the ASME Code must be postweld heat treated. Each chlorine tank must be fully radiographed and postweld heat treated in accordance with the provisions of the ASME Code under which it is constructed. Where postweld heat treatment is required, the tank must be treated as a unit after completion of all the welds in and/or to the shells and heads. The method must be as prescribed in the ASME Code. Welded attachments to pads may be made after postweld heat treatment. A tank used for anhydrous ammonia must be post-weld heat treated. The post-weld heat treatment must be as prescribed in the ASME Code, but in no event at less than 1050° F. tank metal temperature.

§ 178.337-2 **Material.** (a) **General.** (1) All material used for construction of the tank and appurtenances must be suitable for use with the commodities to be transported therein and must comply with the requirements of the ASME Code and/or requirements of the American Society for Testing and Materials in all respects.

(2) Impact tests are required on steel used in fabrication of each tank constructed in accordance with Part UHT of the ASME Code. The tests must be made on a lot basis. A lot is defined as 100 tons or less of the same heat treatment processing lot having a thickness variation no greater than plus or minus 25 percent. The minimum impact required for full size specimens must be 20 foot-pounds in the longitudinal direction at −30° F., Charpy V-Notch and 15 foot-pounds in the transverse direction at −30° F., Charpy V-Notch. The required values for subsize specimens must be reduced in direct proportion to the cross-sectional area of the specimen beneath the notch. If a lot does not meet this requirement, individual plates may be accepted if they individually meet this requirement.

(3) The fabricator shall record the heat, and slab numbers, and the certified Charpy impact values, where required, of each plate used in each tank on a sketch showing the location of each plate in the shell and heads of the tank. Copies of each sketch shall be provided to the owner and retained for at least five years by the fabricator and made available to duly identified representatives of the Department of Transportation.

(4) The direction of final rolling of the shell material shall be the circumferential orientation of the tank shell.

(b) **For a chlorine tank.** Plates, the manway nozzle, and anchorage shall be made of carbon steel which meets the following requirements.

(1) For a tank manufactured on or before December 31, 1974—

(i) Material shall conform to ASTM Specification A–3000–58, titled "Steel Plates for Pressure Vessels for Service at Low Temperatures";

(ii) Material shall be Class 1, Grade A, flange or firebox quality;

(iii) Plate impact test specimens, as required under paragraph (a) of this section, shall be of the Charpy keyhole notch type; and

(iv) Plate impact test specimens shall meet the impact test requirements in paragraph (a) of this section in both the longitudinal and transverse directions of rolling at a temperature of minus 45.5° C. (−50° F).

(2) For a tank manufactured on or after January 1, 1975—

(i) Material shall conform to ASTM Specification A–612–72a, Grade B or A–516–72, Grade 65 or 70;

For explanation of abbreviations and reference marks, see last page of this tariff.

(ii) Material shall meet the Charpy V-notch test requirements of ASTM Specification A-20-72a; and

(iii) Plate impact test specimens shall meet the impact test requirements in paragraph (a) of this section in both the longitudinal and transverse directions of rolling at a temperature of minus 40° C. (−40° F).

(c) For ammonia. See §173.33(g)(1) of this subchapter.

§ 178.337-3 Thickness of tank metal. (a) Tank metal thickness must be as required by the ASME Code and paragraph (b) of this section, except that metal of thickness less than three-sixteenths inch may not be used for the shell or heads. A corrosion allowance of 20 percent or 0.10 inch, whichever is less, must be added to the thickness otherwise required for sulfur dioxide and chlorine tank material. In chlorine tanks the wall thickness must be at least five-eighths inch, including corrosion allowance.

(b) The minimum thickness of metal in the tank shell must be such that at no point therein will the stress on a plane normal to the cylindrical axis exceed 25 percent of the minimum specified tensile strength of the metal. For purposes of this requirement, calculation must be made by the formula:

$$S = \left(\frac{T}{2}\right) + \left[\left(\frac{T}{4}\right)^2 + S_s^2\right]^{1/2}$$

where, at any given point under consideration and for the worst combination of loadings:

S = Effective stress as limited by this requirement.

T = The sum of the longitudinal tensile stresses due to internal pressure and other causes including direct tensile stress due to a rearward accelerative force equal to twice the static weight, tensile stress due to the bending moment of a rearward accelerative force equal to twice the static weight, applied at the road surface, and tensile flexure stress due to three times the static weight in vertical loading; and

S_s = The vectoral sum of the shear stresses in the plane in question, including direct vertical shear due to three times the static vertical loading, direct lateral shear due to a lateral accelerative force of twice the static weight, and torsional shear due to a lateral accelerative force equal to twice the static weight, applied at the road surface. Maximum concentrated stresses which might be created at pads and cradles due to shear, bending, and torsion shall also be calculated in accordance with appendix G of the ASME Code 1962 edition.

Note 1: The forces, loads, and stresses concerned in the foregoing requirement relate to the weight of the tank itself, its contents, and articles supported by the tank, not including the weight of structures supporting the tank in normal operating condition. The stresses involved are not all uniform through the length of the tank shell.

(c) Where any tank support is attached to any part of a tank head, the stresses imposed upon the head shall be as required in paragraph (b) of this section with respect to maximum concentrated stresses at pads and cradles.

§ 178.337-4 Joints. (a) Joints shall be as required by the ASME Code, with all undercutting in shell and head material repaired as specified therein.

(b) Welding procedure and welder performance tests must be made annually in accordance with Section IX of the ASME Code. In addition to the essential variables named therein, the following must be considered as essential variables: number of passes; thickness of plate; heat input per pass; and manufacturer's identification of rod and flux. When fabrication is done in accordance with Part UHT of the ASME Code, filler material containing more than 0.08 percent vanadium must not be used. The number of passes, thickness of plate, and heat input per pass may not vary more than 25 percent from the procedure or welder qualifications. Records of the qualifications must be retained for at least 5 years by the tank manufacturer and must be made available to duly identified representatives of the Department and the owner of the tank.

(c) All longitudinal shell welds shall be located in the upper half of the tank.

(d) Edge preparation of shell and head components may be by machine heat processes, provided such surfaces are remelted in the subsequent welding process. Where there will be no subsequent remelting of the prepared surface as in a tapered section, the final 0.050 inch of material shall be removed by mechanical means.

(e) The maximum tolerance for misalignment and butting up shall be in accordance with the ASME Code.

(f) Substructures shall be properly fitted before attachment, and the welding sequence shall be such as to minimize stresses due to shrinkage of welds.

§ 178.337-5 Bulkheads, baffles and ring stiffeners. (a) Not a specification requirement.

§ 178.337-6 Closure for manhole. (a) Each tank constructed in accordance with Part UHT of the ASME Code and other tanks above 3,500 gallons water capacity must be provided with a manhole conforming to paragraph UG-46(g)(1) and other requirements of the ASME Code.

(b) The manhole assembly of cargo tanks constructed after June 30, 1979, may not be located on the front head of the tank.

§ 178.337-7 Overturn protection. (a) See §178.337-10.

§ 178.337-8 Outlets. (a) Outlets generally.

(1) An opening shall be provided on each tank used for the transportation of liquefied materials to afford complete drainage.

(2) With the exception of gauging devices, thermometer wells, and safety relief valves, every opening in every tank used for the transportation of compressed gases other than carbon dioxide shall be (1) closed with a plug, cap, bolted flange, or plate or (2) protected with an excess flow valve or back flow check valve (see §178.337-11(a)) or (3) be fitted with a remote control valve as specified in §178.337-11(c).

(b) Chlorine tank valves. See §173.33(f)(9), (h)(4), and (5) of this subchapter. Regarding chlorine tank outlets, see also §178.337-1(c)(2) of this part.

§ 178.337-9 Safety relief devices, valves and connections. (a) Safety relief valves. (1) See §173.315(i) of this subchapter.

(2) On tanks for carbon dioxide or nitrous oxide see §173.315(i)(9) and (i)(10) of this subchapter.

(3) Each valve must be designed, constructed, and marked for a rated pressure not less than the tank design pressure at the temperature expected to be encountered.

(b) Piping valves, and fittings. (1) See §173.33(f)(1) and (3) of this subchapter.

(2) Piping and fittings must be in conformance with §173.33(f) of this subchapter and must be protected from damage as required by §173.337-10 of this section.

(c) Marking inlets and outlets. All tank inlets and outlets, except safety relief valves, shall be marked to designate whether they communicate with vapor or liquid when the tank is filled to the maximum permitted filling density.

(d) Refrigeration and heating coils.

(1) Refrigeration and heating coils, when installed in any tank, shall be securely anchored, with provision for thermal expansion. They shall be tested externally to at least the tank test pressure, and internally to at least the tank test pressure or at least twice the working pressure of the heating or refrigeration system, if higher, and the tank shall not be placed in or returned to transportation service if any leakage or other evidence of damage is found in these tests. The refrigerant or heating medium to be circulated through the coils must be such as to cause no adverse chemical reaction with the tank or tank contents in case of leakage.

(2) Where any liquid susceptible to freezing, or the vapor of any such liquid, is used for heating or refrigeration, the heating or refrigeration system shall be arranged to permit complete drainage.

§ 178.337-10 Protection of fittings. (a) All valves, fittings, safety relief devices and other accessories to the tank proper shall be protected in accordance with §178.337-10(b) against such damage as could be caused by collision with other vehicles or objects, jack-knifing and overturning. In addition, safety relief valves shall be so protected that in the event of overturn of the vehicle on to a hard surface, their opening will not be prevented and their discharge will not be restricted.

(b) The protective devices or housing must be designed to withstand static loading in any direction equal to twice the weight of the tank and attachments when filled with the lading, using a safety factor of not less than four, based on the ultimate strength of the material to be used, without damage to the fittings protected, and must be made of metal at least ⅜-inch thick.

(c) For chlorine tanks. There shall be a protective housing and manway cover to permit the use of standard emergency kits for controlling leaks in fittings on the dome cover plate. The housing and manway cover must conform to the Chlorine Institute's standards as follows:

(1) Tanks manufactured on or before December 31, 1974: DAG 137-1, dated November 7, 1962, or DAG 137-2, dated September 1, 1971.

(2) Tanks manufactured on or after January 1, 1975: DAG 137-2 dated September 1, 1971.

(d) Each cargo tank shall be provided with at least one rear bumper designed to protect the tank and piping in the event of a rear end collision and minimize the possibility of any part of the colliding vehicle striking the tank. The design shall be such as to transmit the force of a rear end collision in a horizontal line to the chassis of the vehicle. The bumper shall be designed to withstand the impact of the fully loaded vehicle with a deceleration of 2 "g", using a safety factor of four based on the ultimate strength of the bumper material. The bumpers shall conform dimensionally to §393.86, Chapter III of this title.

§ 178.337-11 Emergency discharge control. (a) Excess flow valves and back flow check valves.

(1) Where used as required in §178.337-8(a)(2) excess flow valves or back flow check valves shall be located inside the tank or inside a welded nozzle which is an integral part of the tank.

(2) Excess flow valves must be in conformance with §173.33(h) of this subchapter.

(3) Chlorine tanks. See §173.33(h)(4) of this subchapter.

(b) Shut-off valves. See §173.33(h)(3) of this subchapter.

(c) Liquid or vapor discharge openings. Each liquid or vapor discharge opening in a tank intended to be used for a flammable liquid; flammable compressed gas; hydrogen chloride, refrigerated liquid; or anhydrous ammonia, must be equipped with a remotely controlled internal shut-off valve. However, on any liquid or vapor discharge opening of less than 1¼-inches NPT, an excess flow valve together with a manually operated external valve may be used in place of a remotely controlled internal shut-off valve. The requirements of this paragraph do no apply to a liquid or vapor discharge opening 1¼ inch NPT equipped with an excess flow valve together with a manually operated external

valve before October 1, 1984, or to an engine fuel line on a truck-mounted tank of not over ¾ inch NPT and equipped with a valve having an integral excess flow valve. Each remotely controlled internal valve must comply with the following requirements:

(1) The seat of the valve shall be inside the tank, or in the opening nozzle or flange or in a companion flange bolted to the nozzle or flange.

(2) All parts of the valve inside the tank, nozzle, or companion flange, shall be made of material not subject to corrosion or other deterioration in the presence of the lading.

(3) The arrangement of parts shall be such that damage to parts exterior to the tank will not prevent effective seating of the valve.

(4) The valve may be operated normally by mechanical means, by hydraulic means, or by air, or gas pressure.

(5) On a tank over 3,500 gallons water capacity, each internal shut-off valve must be provided with remote means of automatic closure, both mechanical and thermal, that are installed at the ends of the tank in at least two, diagonally opposite locations. If the discharge connection at the tank is not in the general vicinity of one of the two locations specified above, one additional fusible element must be installed so that heat from a fire in that area will activate the emergency control system. Fusible elements may not have a melting point exceeding 250° F.

(6) On a tank of 3,500 gallons water capacity or less, each internal shut-off valve must be provided with at least one remote control station, and the actuating means may be mechanical. This station must be at one end of the tank, away from the discharge connection area.

§ 178.337-12 Shear section. (a) Design or installation of valves specified in § 178.337-8(a)(2) shall provide adjacent to and outboard of such valves a section which will break under undue strain.

§ 178.337-13 Supporting and anchoring. (a) A cargo tank that is not permanently attached to or integral with a vehicle chassis must be secured by turnbuckles or equally efficient securing devices for drawing the tank down tight on the frame. Anchors, stops, or other means must be provided to prevent relative motion between the tank and the vehicle chassis when the vehicle is in operation.

(b) A tank motor vehicle designed and constructed so that the cargo tank constitutes in whole or in part the stress member used in place of a frame must have the tank supported by external cradles. A cargo tank mounted on a frame must be supported by external cradles or longitudinal members. The cradles, where used, must subtend at least 120 degrees of the shell circumference. The design calculations for the supports must include beam stress, shear stress, torsion stress, bending moment, and acceleration stress, for the loaded vehicle as a unit, using a factor of safety of 4, based on the ultimate strength of the material and on a 2 "g" longitudinal and lateral loading and 3 times the static weight in vertical loading (see Appendix G of the ASME Code).

(c) Where any tank support is attached to any part of a tank head, the stresses imposed upon the head shall be provided for as required in § 178.337-13(b).

(d) No tank support or bumper may be welded directly to the tank. All supports and bumpers shall be attached by means of pads of the same material as the tank. The pad thickness shall be no less than ¼ inch, or the thickness of the shell material if less, and no greater than the shell material. Each pad shall extend at least 4 times its thickness, in each direction, beyond the weld attaching the support or bumper. Each pad shall be preformed to an inside radius no greater than the outside radius of the tank at the place of attachment. Each pad corner shall be rounded to a radius at least ¼ the width of the pad, and no greater than ½ the width of the pad. Weep holes and telltale holes, if used shall be drilled or punched before the pads are attached to the tank. Each pad shall be attached to the tank by continuous fillet welding using filler material having properties conforming to the recommendations of the maker of the shell and head material.

§ 178.337-14 Gauging devices. (a) **Liquid level gauging devices.** See § 173.315(h) of this subchapter.

(b) **Pressure gauges.** See §§ 173.33(f)(7) and 173.315(h) of this subchapter.

(c) **Orifices.** See § 173.315(h)(3) and (4) of this subchapter.

§ 178.337-15 Pumps and compressors. See § 173.33(f)(6) and (10) of this subchapter.

§ 178.337-16 Testing. (a) **Inspection and tests.** Inspection of materials of construction of the tank and its appurtenances and original test and inspection of the finished tank and its appurtenances must be as required by the ASME Code and as further required by this specification except that for tanks constructed in accordance with Part UHT of the ASME Code the original test pressure must be at least twice the tank design pressure.

(b) **Weld testing and inspection.**

(1) Each tank constructed in accordance with Part UHT of the ASME Code must be subjected, after postweld heat treatment and hydrostatic tests, to a wet fluorescent magnetic particle inspection to be made on all welds in or on the tank shell and heads both inside and out. The method of inspection must conform to Appendix VI of the ASME Code, paragraph UA-70 through UA-72 except that permanent magnets shall not be used.

(2) On tanks of over 3,500 gallons water capacity other than those described in subparagraph (1) of this paragraph unless fully radiographed, a test must be made of all welds in or on the shell and heads both inside and outside by either the wet fluorescent magnetic particle method conforming to Appendix VI of the ASME Code, liquid dye penetrant method, or ultrasonic testing in accordance with Appendix U of the ASME Code. Permanent magnets must not be used to perform the magnetic particle inspection.

(c) All defects found shall be repaired, the tanks shall then again be postweld heat treated, if such heat treatment was previously performed, and the repaired areas shall again be tested.

§ 178.337-17 Marking. (a) **Metal identification plate.** Each tank built after July 1, 1985 shall have a corrosion resistant metal plate permanently affixed by brazing or welding around its perimeter, on the left side (on the right side prior to July 1, 1985) near the front, in a place readily accessible for inspection. It must be maintained in a legible condition. On multitank vehicles plates shall be attached to each tank at the front in a place readily accessible for inspection. Each insulated tank shall have an additional plate, as described, affixed to the jacket in the location specified. Neither the plate itself nor the means of attachment to the tank or jacket may be subject to attack by the tank contents. If the plate is attached directly to the tank by welding it shall be welded thereto before the tank is postweld heat treated. The plate shall be plainly marked by stamping, embossing, or other means of forming letters into the metal of the plate, with the following information in addition to that required by the ASME Code, in characters at least ⅜ inch high.

Vehicle Manufacturer
Vehicle Manufacturer's Serial Number
D.O.T. Specification Number MC-331
Vessel Material Specification Number
Water Capacity in Pounds (see Note 1)
Original Test Date

Note 1. See § 173.315(a) regarding water capacity.

(b) Each cargo tank must also be marked as required by § 177.328 of this subchapter.

§ 178.337-18 Certification. (a) For each tank the tank vehicle manufacturer shall supply and the owner shall obtain the tank manufacturer's data report required by the ASME Code, and a certificate stating that the completed tank vehicle is in complete compliance in all respects with specification MC 331 including the ASME Code. The certificate must be signed by a responsible official of the fabricating firm. The certificate must state whether or not it includes certification that all valves, piping, and protective devices comply with the requirements of the specification. If it does not so certify, the installer of any such valve, piping, or device shall supply and the owner shall obtain a certificate asserting complete compliance with these specifications for such devices. The certificate, or certificates, will include sufficient sketches, drawings, and other information to indicate the location, make, model, and size of each valve and the arrangement of all piping associated with the tank.

(1) The certificate must contain a statement indicating whether or not the cargo tank was post-weld heat treated for anhydrous ammonia as specified in § 178.337-1(f).

(b) The owner shall retain the copy of the data report and certificates and related papers in his files throughout his ownership of the tank and for at least one year thereafter; and in the event of change in ownership, retention by the prior owner of nonfading photographically reproduced copies will be deemed to satisfy this requirement. Each motor carrier using the tank, if not the owner thereof, shall obtain a copy of the data report and certificate and retain them in his files during the time he uses the tank and for at least one year thereafter.

---

§ 178.338 Specification 338; insulated cargo tank.

§ 178.338-1 General requirements.

(a) For the purposes of this section—

(1) "Design pressure" means the "maximum allowable working pressure" as used in the ASME Code, and is the gauge pressure at the top of the tank.

(2) "Design service temperature" means the coldest temperature for which the tank is suitable (see §§ 173.318(a)(1) and (f) of this subchapter).

(b) Each cargo tank must consist of a suitably supported welded inner vessel enclosed within an outer shell or jacket, with insulation between the inner vessel and outer shell or jacket, and having piping, valves, supports and other appurtenances as specified in this subchapter. For the purpose of this specification, "tank" means inner vessel and "jacket" means either the outer shell or insulation cover.

(c) Each tank must be designed and constructed to meet the requirements of the ASME Code.

(1) The design pressure of the tank must be at least 25.3 psig but not more than 500 psig. To determine the required thicknesses of the parts of the tank, the static head of the lading shall be added to the design pressure. If the jacket is evacuated, the tank must be designed for a pressure of 14.7 psi, plus the lading static head, higher than its "design pressure." The jacket must be designed in accordance with paragraph (e) or (f) of this section, as appropriate.

(2) The design service temperature of the tank, piping and valves may not be warmer than the liquefaction temperature at one atmosphere of the lading to be transported (see §§ 173.318(a)(1) and (f) of this subchapter).

(3) Design and construction details of the tank interior may not allow collection and retention of cleaning material's or contaminants. To preclude the entrapment of foreign material, the design and construction of the tank must allow washing of all interior surfaces by the normal surging of the lading during transporation.

(d) The exterior surface of the tank must be insulated with a material compatible with the lading.

(1) Each cargo tank must have an insulation system that will prevent the tank pressure from exceeding the pressure relief valve set pressure within the specified holding time when the tank is loaded with the specific cryogenic liquid at the design conditions of—

(i) The specified temperature and pressure of the cryogenic liquid, and

(ii) The exposure of the filled cargo tank to an average ambient temperature of 85° F.

(2) For a cargo tank used to transport oxygen, the insulation may not sustain combustion in a 99.5 percent oxygen atmosphere at atmospheric pressure when contacted with a continuously heated glowing platinum wire. The cargo tank must be marked in accordance with § 178.338-18(b)(7).

(3) Each vacuum-insulated cargo tank must be provided with a connection for a vacuum gauge to indicate the absolute pressure within the insulation space.

(e) The insulation must be completely covered by a metal jacket. The jacket or the insulation must be so constructed and sealed as to prevent moisture from coming into contact with the insulation (see § 173.318(a)(3) of this subchapter). Minimum metal thicknesses are as follows:

Type metal	Jacket evacuated		Jacket not evacuated	
	Gauge	Inches	Gauge	Inches
Stainless steel	18	0.0428	22	0.0269
Low Carbon Mild Steel	12	0.0946	14	0.0677
Aluminum		0.125		0.1000

(f) An evacuated jacket must be in compliance with the following requirements:

(1) The jacket must be designed to sustain critical collapsing pressure of 30 psi.

(2) If the jacket also supports additional loads, such as the weight of the tank and lading, the combined stress, computed according to the formula in § 178.338-3(b), may not exceed 25 percent of the minimum specified tensile strength.

§ 178.338-2 Material.

(a) All material used in the construction of a tank and its appurtenances that may come in contact with the lading must be compatible with the lading to be transported. All material used for tank pressure parts must conform to the requirements of the ASME Code. All material used for evacuated jacket pressure parts must conform to the chemistry and steelmaking practices of one of the material specifications of Section II of the ASME Code or the following ASTM Specifications: A 242, A 441, A 514, A 572, A 588, A 606, A 607, A 633, A 715.

(b) All tie-rods, mountings, and other appurtenances within the jacket and all piping, fittings and valves must be of material suitable for use at the lowest temperature to be encountered.

(c) Impact tests are required on all tank materials, except aluminum, and must be performed using the procedure prescribed in the ASME Code.

(d) The direction of final rolling of the shell material must be the circumferential orientation of the tank shell.

(e) Each tank constructed in accordance with Part UHT of the ASME Code must be postweld heat treated as a unit after completion of all welds to the shell and heads. Other tanks must be postweld heat treated as required by the ASME Code. For all tanks the method must be as prescribed in the ASME Code. Welded attachments to pads may be made after postweld heat treatment.

(f) The fabricator shall record the heat and slab numbers and the certified Charpy impact values of each plate used in the tank on a sketch showing the location of each plate in the shell and heads of the tank. A copy of the sketch must be provided to the owner of the cargo tank and a copy must be retained by the fabricator for at least five years and made available, upon request, to any duly identified representative of the Department.

§ 178.338-3 Metal thickness.

(a) The metal thickness of the tank must be as prescribed in the ASME Code and paragraph (b) of this section. Metal less than 0.187 inch thick may not be used for the shell or heads of a tank unless the tank is enclosed in an evacuated or load-bearing jacket. Metal less than 0.110 inch thick may not be used for the shell or heads of the tank under any circumstances.

(b) The minimum thickness of metal in the shell (cylindrical portion) of the tank must be such that at no point will the stress on a plane normal to the longitudinal axis exceed 25 percent of the minimum specified tensile strength of the metal. The forces, loads, and stresses considered in this requirement must take into account the weight of the tank itself, its maximum weight of contents, and articles supported by the tank, not including the weight of structures supporting the tank in normal conditions. The stresses involved are not all uniform through the length of the tank. For purposes of this requirement, calculation must be made by the following formula:

$$S = (T^2 + 4(T^2 + S_v^2))^{0.5}$$

where at any point under consideration and for the worst combination of loadings

S = Effective stress as limited by this requirement, in psi;

T = The sum of the longitudinal tensile stresses due to external vacuum and internal pressure and other causes, including direct tensile stress due to a rearward acceleration force, tensile stress due to the bending moment of a rearward acceleration force applied at the road surface, and tensile flexure stress using applicable static loadings specified in paragraphs (b), (e) and (f) of § 178.338-13, in psi; and

S_v = The vectorial sum of the shear stresses in the plane in question, including direct vertical shear due to the static vertical loading, direct lateral shear due to a lateral accelerative force, and torsional shear due to a lateral accelerative force, applied at the road surface using applicable static loadings specified in paragraphs (b), (e) and (f) of § 178.338-13, in psi.

(c) Maximum stress concentrations that may be created at supports due to shear, bending, and torsion must be calculated in accordance with Appendix G of the ASME Code.

(d) Where a tank support is attached to any part of a tank head, the stresses imposed on the head must be in accordance with the requirements in paragraph (c) of this section.

§ 178.338-4 Joints

(a) All joints in the tank, and in the jacket if evacuated, must be as prescribed in the ASME Code, except that a butt weld with one plate edge offset is not authorized.

(b) Welding procedure and welder performance tests must be made in accordance with Section IX of the ASME Code. Records of the qualification must be retained by the tank manufacturer for at least five years and must be made available, upon request, to any duly identified representative of the Department, or the owner of the cargo tank.

(c) All longitudinal welds in tanks and load bearing jackets must be located so as not to intersect nozzles or supports other than load rings and stiffening rings.

(d) Substructures must be properly fitted before attachment and the welding sequence must minimize stresses due to shrinkage of welds.

(e) Filler material containing more than 0.05 percent vanadium may not be used with quenched and tempered steel.

(f) All tank nozzle-to-shell and nozzle-to-head welds must be full penetration welds.

§ 178.338-5 Stiffening rings.

(a) A tank is not required to be provided with stiffening rings, except as prescribed in the ASME Code.

(b) If a jacket is evacuated, it must be constructed in compliance with § 178.338-1(f). Stiffening rings may be used to meet these requirements.

§ 178.338-6 Manholes.

(a) Each tank in oxygen service must be provided with a manhole as prescribed in the ASME Code.

(b) EAch tank having a manhole must be provided with a means of entrance and exit through the jacket, or the jacket must be marked to indicate the manway location on the tank.

(c) A manhole with a bolted closure may not be located on the front head of the tank.

§ 178.338-7 Openings.

(a) The inlet to the liquid product discharge opening of each tank intended for flammable ladings must be at the bottom centerline of the tank.

(b) If the leakage of a single valve, except a pressure relief valve, pressure control valve, fill hydrock or gas phase manual vent valve, would permit loss of flammable material, an additional closure that is leak tight at the tank design pressure must be provided outboard of such valve.

§ 178.338-8 Pressure relief devices, piping, valves, and fittings.

(a) Pressure relief devices. Each tank pressure relief device must be designed, constructed, and marked in accordance with § 173.318(b) of this subchapter.

(b) Piping, valves, and fittings.

(1) All piping, valves, and fittings shall be as required by §§ 173.33(f) and 173.318(b) of this subchapter.

(2) Each valve must be suitable for the tank design pressure at the tank design service temperature.

(3) All fittings must be rated for the maximum tank pressure and suitable for the coldest temperature to which they will be subjected in actual service.

(4) All piping, valves and fittings must be grouped as protected from damage as required by § 178.338-10.

(5) When a pressure-building coil is used on a tank designed to handle oxygen or flammable ladings, the vapor connection to the coil must be provided with a valve or check valve as close to the tank as practicable to prevent the loss of vapor from the tank in case of damage to the coil. The liquid connection to that coil must also be provided with a valve.

§ 178.338-9 Holding time.

(a) "Holding time" is the time, as determined by testing, that will elapse from loading until the pressure of the contents, under equilibrium conditions, reaches the level of the lowest pressure control valve or pressure relief valve setting.

(b) Holding time test.

(1) The test to determine holding time must be performed by charging the tank with a cryogenic liquid having a boiling point, at a pressure of one atmosphere, absolute, no lower than the design service temperature of the tank. The tank must be charged to its maximum permitted filling density with that liquid and stabilized to the lowest practical pressure, which must be equal to or less than the pressure to be used for loading. The cargo tank together with its contents must then be exposed to ambient temperature.

(2) The tank pressure and ambient temperature must be recorded at 3-hour intervals until the pressure level of the contents reaches the set-to-discharge pressure of the pressure control valve or pressure relief valve with the lowest setting. This total time lapse in hours represents the measured holding time at the actual average ambient temperature. This measured holding time for the test cryogenic liquid must be adjusted to an equivalent holding time for each cryogenic liquid that is to be identified on or adjacent to the specification plate, at an average ambient temperature of 85° F. This is the rated holding time (RHT). The marked rated holding time (MRHT) displayed on or adjacent to the specification plate (see § 178.338(b)(9)) may not exceed this RHT.

(c) Optional test regimen.

(1) If more than one cargo tank is made to the same design, only one cargo tank must be subjected to the full holding time test at the time of manufacture. However, each subsequent cargo tank made to the same design must be performance tested during its first trip. The holding time determined in this test may not be less than 90 percent of the marked rated holding time. This test must be performed in accordance with §§ 173.33(d)(1)(ii) and 177.840(h) of this subchapter, regardless of the classification of the cryogenic liquid.

(2) Same design. The term "same design" as used in this section means cryogenic cargo tanks made—

(i) By the same manufacturer;
(ii) To the same engineering drawings, and calculations;
(iii) To the same dimensions of length, diameter, and volume;
(iv) Of the same materials of construction; and
(v) With the same insulation system.

(3) For a cargo tank used in nonflammable cryogenic liquid service, in place of the holding time tests prescribed in paragraph (b) of this section, the marked rated holding time (MRHT) may be determined as follows:

(i) While the cargo tank is stationary, the heat transfer rate must be determined by measuring the normal evaporation rate (NER) of the test cryogenic liquid (preferably the lading, where feasible) maintained at approximately one atmosphere. The calculated heat transfer rate must be determined from:

$$q = [n(\Delta h)(65 - t_l)]/[t_s - t_l]$$

Where:

q = calculated heat transfer rate to cargo tank with lading, Btu/hr.
n = normal evaporation rate (NER), which is the rate of evaporation, determined by the test of a test cryogenic liquid in a cargo tank maintained at a pressure of approximately one atmosphere, absolute, lb/hr.
Δh = latent heat of vaporization of test fluid at test pressure, Btu/lb.
t_s = average temperature of outer shell during test, °F.
t_l = equilibrium temperature of lading at maximum loading pressure, °F.
t_l = equilibrium temperature of test fluid at one atmosphere, °F.

(ii) The rated holding time (RHT) must be calculated as follows:

$$RHT = [(U_2 - U_1)W]/q$$

Where:

RHT = rated holding time, in hours.
U_2 and U_1 = internal energy for the combined liquid and vapor lading at the pressure offered for transportation, and the set pressure of the applicable pressure control valve or pressure relief valve, respectively, Btu/lb.
W = total weight of the combined liquid and vapor lading in the cargo tank, pounds.
q = calculated heat transfer rate to cargo tank with lading, Btu/hr.

(iii) The MRHT (see § 178.338-18(b)(9) of this subchapter) may not exceed the RHT.

§ 178.338-10 Collision damage protection.

(a) All valves, fittings, pressure relief devices and other accessories to the tank proper, which are not isolated from the tank by closed intervening shut-off valves or check valves, must be installed within the motor vehicle framework or within a suitable collision resistant guard or housing, and appropriate ventilation must be provided. Each pressure relief device must be protected so that in the event of the upset of the vehicle onto a hard surface, the device's opening will not be prevented and its discharge will not be restricted.

(b) Each protective device or housing, and its attachment to the vehicle structure, must be designed to withstand static loading in any direction that it may be loaded as a result of front, rear, side, or sideswipe collision, or the overturn of the vehicle. The static loading shall equal twice the loaded weight of the tank and attachments. A safety factor of four, based on the tensile strength of the material, shall be used. The protective device or the housing must be made of steel at least ¼-inch thick, or other material of equivalent strength.

(c) Each tank motor vehicle must be provided with at least one rear bumper designed to protect the cargo tank and piping in the event of a rear end collision. The bumper design must transmit the force of the collision directly to the chassis of the vehicle. The rear bumper and its attachments to the chassis must be designed to withstand a load equal to twice the weight of the loaded cargo tank and attachments, using a safety factor of four based on the tensile strength of the materials used, with such load being applied horizontally and parallel to the major axis of the cargo tank, or within 30 horizontal degrees thereof. The rear bumper dimensions must meet the requirements of § 393.86 of this title and extend vertically to a height adequate to protect all valves and fittings located at the rear of the cargo tank from damage that could result in loss of lading.

(d) Every part of the loaded cargo tank, and any associated valve, pipe, enclosure, or protective device or structure (exclusive of wheel assemblies), must be at least 14 inches above level ground.

§ 178.338-11 Discharge control devices.

(a) Excess-flow valves are not required.

(b) Each liquid filling and liquid discharge line must be provided with a shut-off valve located as close to the tank as practicable. Unless this valve is manually operable at the valve, the line must also have a manual shut-off valve.

(c) Each liquid filling and liquid discharge line on a cargo tank intended for service transporting a flammable lading must be provided with a remotely controlled shut-off valve. If pressure from a reservoir or from an engine driven pump or compressor is used to open this valve, the control must be of fail-safe design, spring-biased to stop the admission of such pressure. If the jacket is not evacuated, the seat of the valve must be inside the tank, in the opening nozzle or flange, or in a companion flange bolted to the nozzle. If the jacket is evacuated, the remotely controlled valve must be located as close to the tank as practicable.

(1) On a cargo tank with a capacity in excess of 3,500 gallons of water, each remotely controlled shut-off valve must be provided with remote means of automatic closure, both mechanical and thermal, installed at the ends of the cargo tank in at least two diagonally opposite locations. The thermal means shall consist of fusible elements actuated at a temperature not exceeding 250° F., or equivalent devices. One means may be used to close more than one remotely controlled valve.

(2) On a cargo tank with a capacity of 3,500 gallons of water or less, each remotely controlled shut-off valve must be provided with at least one remote control station on the end of the cargo tank opposite the main control station. The remote control station must contain a manual means of closure. In addition, it may contain fusible elements actuated at a temperature not exceeding 250° F., or equivalent devices. One means may be used to close more than one remotely controlled valve.

§ 178.338-12 Shear section.

Unless the valve is located in a rear cabinet forward of and protected by the bumper (see § 178.338-10(c)) and the design installation of each valve, damage to which could result in loss of liquid or vapor, must incorporate a shear section or breakage groove adjacent to, and outboard of, the valve. The shear section or breakage groove must yield or break under strain without damage to the valve that would allow the loss of liquid or vapor. The protection specified in § 178.338-10 is not a substitute for a shear section or breakage groove.

§ 178.338-13 Supports and anchoring.

(a) All attachments of supports and bumpers to tanks and to load-bearing jackets must be made by means of pads of material similar to that of the tank or jacket, by load rings, or by bosses designed or gusseted to distribute the load. The pad must be at least ¼-inch thick, or as thick as the tank or jacket material, if less, but shall in no case be thicker than the tank or jacket material. Each pad must extend at least four times its thickness, in each direction, beyond the weld attaching the support or bumper. Each pad must be performed to an inside radius no greater than the outside radius of the tank or jacket at the place of attachment. Each pad corner must be rounded to a radius at least one-fourth the width of the pad and no greater than one-half the width of the pad. If weep holes or telltale holes are used, they must be drilled or punched before the pads are attached. Each pad must be attached to the tank or jacket by continuous fillet welding using filler material having properties conforming to the recommendations of the manufacturer of the tank or jacket material. Any fillet weld discontinuity may only be for the purpose of preventing an intersection between the fillet weld and a tank or jacket seam weld.

(b) A tank motor vehicle constructed so that the cargo tank constitutes in whole or in part the structural member used in place of a motor vehicle frame must have the tank or the jacket supported by external cradles or by load rings. A cargo tank mounted on a motor vehicle frame must have the tank or jacket supported by external cradles, load rings, or longitudinal members. If cradles are used, they must subtend at least 120 degrees of the cargo tank circumference. The design calculations for the supports and load bearing tank or jacket, and the support attachments must include beam stress, shear stress, torsion stress, bending moment, and acceleration stress for the loaded vehicle as a unit, using a safety factor of four, based on the tensile strength of the material, and static loadings that take into consideration the weight of the cargo tank and its attachments when filled to the design weight of the lading (see Appendix G of the ASME Code). The effects of fatigue must also be considered in the calculations. Minimum static loadings must be as follows:

(1) For a vacuum insulted cargo tank—
(i) Vertically downward of 2;
(ii) Vertically upward of 2;
(iii) Longitudinally of 2, and
(iv) Laterally of 2.
(2) For a nonvacuum-insulated cargo tank—
(i) Vertically downward of 3;
(ii) Vertically upward of 2,
(iii) Longitudinally of 2; and
(iv) Laterally of 2.

(c) When a loaded tank is supported within the vacuum jacket by structural members, the design calculations for the tank and its structural members must be based on a safety factor of four and the tensile strength of the material at ambient temperature. The enhanced tensile strength of the material at actual operating temperature may be substituted for the tensile strength at ambient temperature to the extent recognized in the ASME Code for static loadings. Static loadings must take into consideration the weight of the tank and the structural members when the tank is filled to the design weight of lading (see Appendix G of the ASME Code). When load rings in the jacket are used for supporting the tank they must be designed to carry the fully loaded tank at the specified static loadings, plus external pressure. Minimum static loadings must be as follows:

(1) Vertically downward of 2;
(2) Vertically upward of 1½;
(3) Longitudinally of 1½; and,
(4) Laterally of 1½.

§ 178.338-14 Gauging devices.

(a) Liquid level gauging devices.

(1) Unless a cargo tank is intended to be filled by weight, it must be equipped with one or more gauging devices, which accurately indicate the maximum permitted liquid level at the loading pressure, in order to provide a minimum of two percent outage below the inlet of the pressure control valve or pressure relief valve at the condition of incipient opening of that valve. A fixed-length dip tube, a fixed trycock line, or a differential pressure liquid level gauge must be used as the primary control for filling. Other gauging devices, except gauge glasses, may be used, but not as the primary control for filling.

(2) The design pressure of each liquid level gauging device must be at least that of the tank.

(3) If a fixed length dip tube or trycock line gauging device is used, it must consist of a pipe or tube of small diameter equipped with a valve at or near the jacket and extending into the cargo tank to a specified filling height. The fixed height at which the tube ends in the cargo tank must be such that the device will function when the liquid reaches the maximum level permitted in loading.

(4) The liquid level gauging device used as a primary control for filling must be designed and installed to accurately indicate the maximum filling level at the point midway of the tank both longitudinally and laterally.

(b) Pressure gauges. Each cargo tank must be provided with a suitable pressure gauge indicating the lading pressure and located on the front of the jacket so it can be read by the driver in the rear view mirror. Each gauge must have a reference mark at the cargo tank design pressure or the set pressure of the pressure relief valve or pressure control valve, whichever is lowest.

(c) Orifices. All openings for dip tube gauging devices, trycock lines, and pressure gauges must be restricted at or inside the jacket by orifices no larger than 0.060-inch diameter.

§ 178.338-15 Cleanliness.

A cargo tank constructed for oxygen service must be thoroughly cleaned to remove all foreign material in accordance with CGA Pamphlet G-4.1. All loose particles from fabrication, such as weld beads, dirt, grinding wheel debris, and other loose materials, must be removed prior to the final closure of the manhole of the tank. Chemical or solvent cleaning with a material compatible with the intending lading must be performed to remove any contaminants likely to react with the lading.

§ 178.338-16 Inspection and testing.

(a) General. The material of construction of a tank and its appurtenances must be inspected for conformance to the ASME Code. The tank must be subjected to either a hydrostatic or pneumatic test. The test pressure must be one and one-half times the sum of the design pressure, plus static head of lading, plus 14.7 psi if subjected to external vacuum, except that for tanks constructed in accordance with Part UHT of the ASME Code the test pressure must be twice the design pressure.

(b) Additional requirements for pneumatic test. A pneumatic test may be used in place of the hydrostatic test. Due regard for protection of all personnel should be taken because of the potential hazard involved in a pneumatic test. The pneumatic test pressure in the tank must be reached by gradually increasing the pressure to one-half of the test pressure. Thereafter, the test pressure must be increased in steps of approximately one-tenth of the test pressure until the required test pressure has been reached. Then the pressure must be reduced to a value equal to four-fifths of the test pressure and held for a sufficient time to permit inspection of the cargo tank for leaks.

(c) Weld inspection. All tank shell or head welds subject to pressure shall be radiographed in accordance with the ASME Code. A tank which has been subjected to inspection by the magnetic particle method, the liquid penetrant method, or any method involving a material deposit on the interior tank surface, must be cleaned to remove any such residue by scrubbing or equally effective means, and all such residue and cleaning solution must be removed from the tank prior to final closure of the tank.

(d) Defect repair. All cracks and other defects must be repaired as prescribed by the ASME Code. The welder and the welding procedure must be qualified in accordance with the ASME Code. After repair, the tank must again be postweld heat-treated, if such heat treatment was previously performed, and the repaired areas must be retested.

(e) Verification must be made of the interior cleanliness of a tank constructed for oxygen service by means that assure that all contaminants that are likely to react with the lading have been removed as required by §178.338-15.

§ 178.338-17 Pumps.

See §§173.33(f) and 173.318(a)(4) of this subchapter.

§ 178.338-18 Marking.

(a) Nameplate. Each tank built after July 1, 1985 shall have a corrosion resistant metal plate permanently affixed by brazing or welding around its perimeter, on the left side (on the right side prior to July 1, 1985) near the front. If this nameplate is attached by welding, it must be welded before the tank is postweld heat-treated. The nameplate must be plainly marked by stamping, embossing, or other means of forming letters into the metal of the plate, in characters at least ⅜-inches high. The following information, in addition to that required by the ASME Code, must be included (parenthetical abbreviations may be used):

(1) DOT Specification number MC-338 (DOT MC-338);
(2) Material specification number (Mat. Spec. No.);
(3) Maximum density of lading for which the tank is designed (Max. Dens. of Lading);
(4) Water capacity, in pounds net at 60° F, with the tank at its coldest operating temperature, after deduction for the volume above the inlet to the pressure relief device or pressure control valve, structure members, baffles, piping, and other appurtenances inside the tank (W. Cap.); and
(5) Original test date (Orig. Test Date);

(b) Specification plate. Each tank built after July 1, 1985 shall have an additional plate, in the form specified in paragraph (a) of this section. It must be welded, brazed, or riveted to the jacket on the left side (on the right side prior to July 1, 1985) near the front, or at the control station, in a position readily legible to operating personnel. It must be marked with the information specified in paragraph (a) of this section and in addition, in characters at least ⅜-inches high, the following (parenthetical abbreviations may be used):

(1) Vehicle manufacturer (Veh. Mfr.);
(2) Manufacturer's vehicle serial number (Veh. No.);
(3) Lining material, if any (Lining);
(4) Date of manufacture (Date of Mfr.);
(5) Certificate date (Cert. Date);
(6) Design service temperature (Design Serv. Temp.);
(7) "Insulation for Oxygen Service" or "Not Authorized for Oxygen Service," as appropriate;
(8) Maximum weight of lading for which the cargo tank is designed, in pounds (Max. Net Wgt.——lbs.);
(9) Marked rated holding time for at least one cryogenic liquid, in hours, and the name of the cryogenic liquid (MRHT-hrs., name of cryogenic liquid). MRHT markings for additional cryogenic liquids may be displayed on or adjacent to the specification plate.

(c) The design weight of lading used in determining the loading in §§178.338-3(b), 178.339-10 (b) and (c), and 178.338-13 (b) and (c) must be shown as the maximum weight of lading marking required by paragraph (b) of this section.

§ 178.338-19 Certification.

(a) The manufacturer of a cargo tank vehicle shall furnish to the owner of the completed vehicle, at or before the time of delivery, the following:

(1) the tank manufacturer's data report required by the ASME Code.
(2) a photograph, pencil rub, or other facsimile of the plates required by paragraphs (a) and (b) of §178.338-18, and
(3) a certificate bearing the manufacturer's vehicle serial number stating that the completed cargo tank vehicle conforms to all applicable requirements of Specification MC-338, including the ASME Code, in effect on the date (month, year) of certification.

(b) In the case of a cargo tank vehicle manufactured in two or more stages, each manufacturer who performs a manufacturing operation on the incomplete vehicle or portion thereof shall furnish to the succeeding manufacturer, at or before the time of delivery, a certificate covering the particular operation performed by that manufacturer and any certificates received from previous manufacturers. The certificates must include sufficient sketches, drawings, and other information to indicate the location, make, model and size of each valve and the arrangement of all piping associated with the tank. Each certificate must be signed by an official of the manufacturing firm responsible for the portion of the complete cargo tank vehicle represented thereby, such as basic tank fabrication, insulation, jacket, or piping. The final manufacturer shall furnish the owner with all certificates, as well as the documents required by paragraph (a) of the section.

(c) The owner shall retain the data report, certificates, and related papers throughout his ownership of the cargo tank. In the event of change of ownership, the prior owner shall retain non-fading photographically reproduced copies of these documents for at least one year. Each operator using the cargo tank vehicle, if not the owner thereof, shall obtain a copy of the data report and the certificate or certificates and retain them during the time he uses the cargo tank and for at least one year thereafter.

---

§ 178.340 General design and construction requirements applicable to specifications MC 306 (§178.341), MC 307 (§178.342), and MC 312 (§178.343) cargo tanks.

§ 178.340-1 Specification requirements for MC 306, MC 307 and MC 312 cargo tanks. (a) Specification MC 306, MC 307 and MC 312 cargo tanks constructed on or after December 1, 1967, for the bulk transportation of hazardous commodities must meet the requirements contained in this section in addition to the requirements of each applicable specification as contained in §178.341 (MC 306), §178.342 (MC 307) and §178.343 (MC 312).

(b) All of these specification requirements are minimum requirements.

§ 178.340-2 General requirements. (a) Every cargo tank and vessel shall be designed and constructed in accordance with the best known and available practices in addition to the other applicable cargo tank specification requirements.

(b) Those requirements relating to parts and accessories applicable to all motor vehicles engaged in interstate commerce as contained in Part 393 of this Title of the Motor Carrier Safety Regulations are an integral part of this specification.

(c) Where applicable the additional requirements prescribed in Part 173 to accommodate specific commodities are considered an integral part of these specifications.

(d) Multi-purpose cargo tank.

(1) A single cargo tank may be divided into compartments of different specification construction. Each such compartment shall conform to specification requirements concerned.

(2) A single cargo tank may be physically altered to comply with another cargo tank specification in these regulations; or altered to accommodate a commodity not requiring a DOT specification tank.

§ 178.340-3 Material. (a) All sheet and plate material for shell, heads, bulkheads and baffles for cargo tanks which are not required to be constructed in accordance with the American Society of Mechanical Engineers' Boiler and Pressure Vessel Code shall meet the following minimum applicable requirements:

(1) **ALUMINUM ALLOYS (AL).** Only aluminum alloy material suitable for fusion welding and in compliance with one of the following ASTM specifications shall be used:

ASTM B-209 Alloy 5052	ASTM B-209 Alloy 5254
ASTM B-209 Alloy 5086	ASTM B-209 Alloy 5454
ASTM B-209 Alloy 5154	ASTM B-209 Alloy 5652

All heads, bulkheads, baffles, and ring stiffeners may use O temper (annealed) or stronger tempers. All shells shall be made of materials with properties equivalent to H 32 or H 34 tempers, except that lower ultimate strength tempers may be used if the minimum shell thicknesses in Table II in §§178.341-2, 178.342-2, or 178.343-2 are increased in inverse proportion to the lesser ultimate strength.

(2) STEEL.

	Mild steel (MS)	High strength low alloy steel (HSLA)	Austenitic stainless steel (SS)
Yield	25,000 psi	45,000 psi	25,000 psi
Ultimate strength	45,000 psi	60,000 psi	70,000 psi
Elongation, 2 inch samples	20%	25%	30%

§ 178.340-4 Structural integrity. (a) **Maximum stress values.** The maximum calculated stress value must not exceed 20 percent of the minimum ultimate strength of the material as authorized in §178.340-3, except when ASME Code pressure vessel design requirements apply.

(b) **Loadings.** Cargo tanks shall be provided with additional structural elements as necessary to prevent resulting stresses in excess of those permitted in paragraph (a) of this subsection. Consideration shall be given to forces imposed by each of the following loads individually, and where applicable a vector summation of any combination thereof:

(1) Dynamic loading under all product load configurations.

(2) Internal pressure.

(3) Superimposed loads such as operating equipment, insulation, linings, hose tubes, cabinets and piping.

(4) Reactions of supporting lugs and saddles or other supports.

(5) Effect of temperature gradients resulting from product and ambient temperature extremes. Thermal coefficients of dissimilar materials where used should be accommodated.

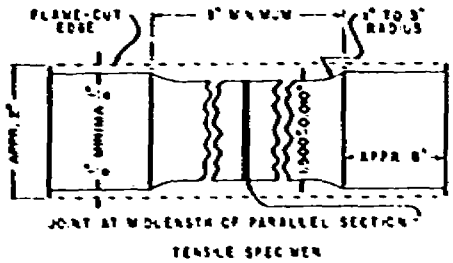
§ 178.340-5 Joints. (a) **Method of joining.** All joints between tank shells, heads, baffles (or baffle attaching rings), and bulkheads shall be welded in accordance with the requirements contained in this section.

(b) **Strength of joints (Aluminum Alloy (AL)).** All welded aluminum alloy joints shall be made in accordance with recognized good practice, and the efficiency of a joint shall be not less than 85 percent of the properties of the adjacent material. Aluminum alloys shall be joined by an inert gas arc welding process using aluminum-magnesium type of filler metals which are consistent with the material suppliers recommendations.

(c) **Strength of joints (Mild Steel (MS), High Strength Low Alloy (HSLA), Austenitic Stainless Steel (SS)).** Joints shall be welded in accordance with recognized good practice and the efficiency of any joint shall be not less than 85 percent of the mechanical properties of the adjacent metal in the tank.

(1) Combinations of mild steel (MS), high strength low alloy (HSLA) and or austenitic stainless steel (SS) may be used in the construction of a single tank, provided that each material, where used, shall comply with the minimum requirements specified in §178.340-3(a) for the material used in the construction of that section of the tank. Whenever stainless steel sheets are used in combination with sheets of other types of steel, joints made by welding shall be formed by the use of stainless steel electrodes or filler rods and the stainless steel electrodes or filler rods used in the welding shall be suitable for use with the grade of stainless steel concerned, according to the recommendations of the manufacturer of the stainless steel electrodes or filler rods.

(d) **Compliance test.** Compliance with the requirements contained in paragraph (b) or (c) of this subsection for the welded joints indicated in paragraph (a) of this subsection shall be determined by preparing from materials representative of those to be used in tanks subject to this specification and by the same technique of fabrication, 2 test specimens conforming to figure as shown below and testing them to failure in tension. One pair of test specimens may represent all the tanks to be made of the same combination of materials by the same technique of fabrication, and in the same shop, within six months after the tests of such samples have been completed. The butt welded specimens tested shall be considered qualifying other types or combinations of types of weld using the same filler material and welding process as long as parent metals are of the same types of material.



§ 178.340-6 Supports and anchoring. (a) Cargo tanks with frames not made integral with the tank as by welding, shall be provided with restraining devices to eliminate any relative motion between the tank and frame which may result from the stopping, starting or turning of the vehicle. Such restraining devices shall be readily accessible for inspection and maintenance, except that insulation and jacketing are permitted to cover the restraining devices.

(b) Any cargo tank designed and constructed so that it constitutes in whole or in part the structural member used in lieu of a frame, shall be supported in such a manner that the resulting stress levels in the cargo tank do not exceed those specified in §178.340-4(a). The design calculations of the support elements shall include loadings imposed by stopping, starting and turning in addition to those imposed as indicated in §178.340-4(b) using 20% of the minimum ultimate strength of the support material.

§ 178.340-7 Circumferential reinforcement. (a) Tanks with shell thicknesses less than ¾ of an inch shall in addition to the tank heads be circumferentially reinforced with either bulkheads, baffles, or ring stiffeners. It is permissible to use any combination of the aforementioned reinforcements in a single cargo tank.

(1) **Location.** Such reinforcement shall be located in such a manner that the maximum unreinforced portion of the shell be as specified in Table II of the applicable specification and in no case more than 60 inches. Additionally such circumferential reinforcement shall be located within one inch of points where discontinuity in longitudinal shell sheet alignment exceeds 10 degrees unless otherwise reinforced with structural members capable of maintaining shell sheet stress levels permitted in §178.340-4(a).

(b) **Baffles.** Baffles or baffle attaching rings if used as reinforcement members shall be circumferentially welded to the tank shell. The

welding must not be less than 50% of the total circumference of the vessel and the maximum unwelded space on this joint shall not exceed 40 times the shell thickness.

(c) **Double bulkheads.** Tanks designed to transport different commodities which if combined during transit will cause a dangerous condition or evolution of heat or gas shall be provided with compartments separated by an air space. This air space shall be vented and be equipped with drainage facilities which shall be kept operative at all times.

(d) **Ring stiffeners.** Ring stiffeners when used to comply with this section shall be continuous around the circumference of the tank shell have a section modulus about the neutral axis of the ring section parallel to the shell at least equal to that determined by the following formula:

$$\frac{I}{C} \text{ (Min)} = 0.00027\ WL \text{ (MS, HSLA \& SS) Steel}$$

$$\frac{I}{C} \text{ (Min)} = 0.000457\ WL \text{ (AL) Aluminum Alloy}$$

where:

$\frac{I}{C}$ = section modulus (inches)^3;

W = tank width or diameter (inches);

L = ring spacing (inches); i.e., the maximum distance from the midpoint of the unsupported shell on one side of the ring stiffener to the midpoint of the unsupported shell on the opposite side of the ring stiffener.

(1) If a ring stiffener is welded to the tank shell (with each circumferential weld not less than 50% of the total circumference of the vessel and the maximum unwelded space on this joint not exceeding 40 times the shell thickness) a portion of the shell may be considered as part of the ring section for purposes of computing the ring section modulus. The maximum portion of the shell to be used in these calculations is as follows:

Circumferential ring stiffener to tank shell welds	Distance between parallel circumferential ring stiffener to shell welds	Shell section credit
1	.....	20t
2	Less than 20t	20t + W
2	20t or more	40t

where:

t = shell thickness;

W = distance between parallel circumferential ring stiffener to shell welds.

(2) If configuration of internal or external ring stiffener encloses an air space, this air space shall be arranged for venting and be equipped with drainage facilities which shall be kept operative at all times.

§ 178.340-8 Accident damage protection. (a) **Appurtenances:** The term "appurtenance" means any cargo tank accessory attachment that has no liquid product retention or other liquid containment function, and provides no structural support to the tank.

(1) The design, construction, and installation of any appurtenance to the shell or head of the cargo tank must be such as to minimize the possibility of appurtenance damage or failure adversely affecting the product integrity of the tank.

(2) Structural members, such as the suspension subframe, overturn protection and external rings, when practicable, should be utilized as sites for attachment of appurtenances and any other accessories to a cargo tank.

(3) Except as prescribed in subparagraph (5) of this paragraph, the welding of any appurtenance to a shell or head must be made by attachment to a mounting pad. The thickness of a mounting pad must not be less than that of the shell or head to which it is attached. A pad must extend at least 2 inches in each direction from any point of attachment of an appurtenance. Pads must have rounded corners or otherwise be shaped in a manner to preclude stress concentrations on the shell or head. The mounting pad must be attached by a continuous weld around the pad.

(4) The appurtenance must be attached to the mounting pad so there will be no adverse affect upon the product-retention integrity of the tank if any force is applied to the appurtenance, in any direction, except normal to the tank, or within 45° of normal.

(5) Skirting structures, conduit clips, brakeline clips, and similar lightweight attachments, which are of a metal thickness, construction, or material, appreciably less strong but no more than 72 percent of the thickness of the tank shell or head to which such a device is attached, may be secured directly to the tank shell or head if each device is so designed and installed that damage to it will not affect the product retention integrity of the tank. These lightweight attachments must be secured to the tank shell by continuous weld or in such manner as to preclude formation of pockets, which may become sites for incipient corrosion.

(b) **Rear bumpers.** Every cargo tank shall be provided with a rear bumper to protect the tank and piping in the event of a rear end collision and minimize the possibility of any part of the colliding vehicle striking the tank. The bumper shall be located at least 6 inches to the rear of any vehicle component which is used for loading or unloading purposes or may at any time contain lading while in transit. Dimensionally, the bumper shall conform to § 393.86 of this Title. Structurally, the bumper shall be designed to successfully absorb (no damage which will cause leakage of product) the impact of the vehicle with rated payload, with a deceleration of 2 "g" using a factor of safety of two based on the ultimate strength of the bumper material. For purposes of the regulations in this part such impact shall be considered uniformly distributed and applied horizontally (parallel to the ground) from any direction at an angle not exceeding 30° to the longitudinal axis of the vehicle.

(c) **Overturn protection.** All closures for filling, manhole or inspection openings shall be protected from damage which will result in leakage of lading in the event of overturning of the vehicle by being enclosed within the body of the tank or dome attached to the tank or by guards.

(1) When guards are required, they shall be designed and installed to withstand a vertical load of twice the weight of the loaded tank and a horizontal load in any direction equivalent to one-half the weight of the loaded tank. These design loads may be considered independently. Ultimate strength of the material shall be used as a calculation base. If more than one guard is used each shall carry its proportionate share of the load. If protection other than guards are considered the same design load criteria is applicable.

(2) Except for pressure actuated vents no overturn protection is required for non-operating nozzles or fittings less than five inches in diameter (which do not contain product while in transit) that project a distance less than the inside diameter of the fitting. This projected distance may be measured either from the shell or the top of an adjacent ring stiffener provided such stiffener is within 30 inches of the center of the nozzle or fitting.

(3) If the overturn protection is so constructed as to permit accumulation of liquid on the top of the tank, it shall be provided with drainage facilities directed to a safe point of discharge.

(d) **Piping.**

(1) Product discharge piping shall be provided with protection in such a manner as to reasonably assure against the accidental escape of contents. Such protection may be provided by:

(i) A shear section located outboard of each emergency valve seat and within 4 inches of the vessel which will break under strain and leave the emergency valve seat and its attachment to the vessel and the valve head intact and capable of retaining product. The shear section shall be machined in such a manner as to abruptly reduce the wall thickness of the adjacent piping (or valve) material by at least 20%; or

(ii) By suitable guards capable of successfully absorbing a concentrated horizontal force of at least 8000 pounds applied from any horizontal direction, without damage to the discharge piping which will adversely affect the product retention integrity of the discharge valve.

(2) **Minimum road clearance.** The minimum allowable road clearance of any cargo tank component or protection device located between any two adjacent axles on a vehicle or vehicle combination shall be at least ½ inch for each foot separating such axles and in no case less than 12 inches.

(3) **Strength of piping, fittings, hose and hose couplings.** Hose, piping and fittings for tanks to be unloaded by pressure shall be designed for a bursting pressure of at least 100 psig and not less than four times the pressure to which, in any instance, it may be subjected in service by the action of any vehicle mounted pump or other device (not including safety relief valves), the action of which may be to subject certain portions of the tank piping and hose to pressures greater than the design pressure of the tank. Any coupling used on hose to make connections shall be designed for a working pressure not less than 20% in excess of the design pressure of the hose and shall be so designed that there will be no leakage when connected.

(4) **Provision for expansion and vibration.** Suitable provisions shall be made in every case to allow for and prevent damage due to expansion, contraction, jarring and vibration of all pipe. Slip joints shall not be used for this purpose.

(5) **Heater coils.** Heater coils, when installed, shall be so constructed that the breaking-off of their external connections will not cause leakage of contents of tank.

(6) **Gauging, loading, and air-inlet devices.** Gauging, loading and air-inlet devices, including their valves, shall be provided with adequate means for their secure closure, and means shall also be provided for the closing of pipe connections of valves.

§ 178.340-9 Pumps. (a) Loading or unloading pumps mounted on tractor or trailer, if used, shall be provided with automatic means to prevent the pressure from exceeding the design pressure of the tank mounted equipment.

§ 178.340-10 Certification. (a) Certification as required in paragraphs (b) and (c) of this subsection shall indicate that such cargo tank has been designed, constructed and tested in accordance with the

applicable specification MC 306, MC 307, or MC 312 (§178.341, 178.342 or 178.343).

(1) **Multi-purpose tanks.** If a cargo tank is divided into compartments and each compartment is constructed in accordance with the requirements of a different MC Specification, there shall be a metal plate required in paragraph (b) of this subsection, located on the right side, near the front of each compartment, in a place readily accessible for inspection. Details pertaining to the multipurpose configuration shall also be clearly indicated on the manufacturer's certificate required in paragraph (c) of this subsection.

(i) If a cargo tank is constructed in accordance with the requirements of one specification and may be physically altered to meet another cargo tank specification in this part, or physically altered to accommodate a commodity not requiring a specification tank, such alterations shall be clearly indicated on the manufacturer's certificate required in paragraph (c) of this subsection and the tank mounted multi-purpose plate required in paragraph (b)(2) of this subsection.

(2) **Specification shortages.** If a cargo tank is manufactured which does not meet all of the applicable specification requirements, thereby requiring subsequent manufacturing involving the installation of additional components, parts, appurtenances or accessories, it is permissible for the original manufacturer to affix the metal certification plate required in paragraph (b) of this subsection. The specification requirements not complied with shall be indicated on the manufacturer's certificate required in paragraph (c) of this subsection. When the cargo tank is finally brought into complete compliance, the date such compliance is accomplished shall be stamped on the metal certification plate. The certificate shall indicate the pertinent details, date and concern (manufacturer or carrier) accomplishing complete compliance.

(b) **Metal certification plate.** After July 1, 1985, each cargo tank, or tank compartment if constructed to a different specification, must have a metal certification plate attached to its shell or to an integral supporting structure. The certification plate shall not be subject to corrosion, and must be located on the left side (on the right side prior to July 1, 1985) near the front in a place readily accessible for inspection. Each plate shall be permanently affixed by means of brazing, welding, soldering, riveting, or other equally suitable means. The plate must be marked in characters at least 3/16-inch high by stamping, embossing, or other means of forming letters into or on the metal of the plate itself at least the information prescribed in paragraphs (b)(1) and (b)(2) of this section. The plate may not be painted as to obscure the marking thereon. A combination ASME-DOT certification plate is authorized.

(1) If a cargo tank is to be physically altered to meet another specification (or to accommodate a commodity not requiring a specification tank) such combinations shall be indicated beside Specification Identification. Additionally the metal multi-purpose plates required in subparagraph (2) of this paragraph are required.

Vehicle manufacturer .....
Manufacturer's serial number .....
Specification identification[1] .....
DOT MC 306; or MC 307; or MC 312 .....
Date of manufacture .....
Original test date .....
Certification date .....
Design pressure ..... PSIG
Test pressure ..... PSIG
Head material .....
Shell material .....
Weld material .....
Lining material .....
Nominal tank capacity by compartment (front to rear) ..... US Gal.
Maximum product load ..... lbs.
Loading limits ..... GPM and or PSIG
Unloading limits ..... GPM and or PSIG

[1] The following material designations (or combinations thereof) must be added: Aluminum Alloy (AL), Mild Steel (MS), High Strength Low Alloy (HSLA), Austenitic Stainless Steel (SS). For example "DOT MC 306-AL" for cargo tanks made of aluminum. A multi-purpose cargo tank example would be "Combination MC 306 SS-307 SS."

(2) **Metal multi-purpose plate.** If a cargo tank is to be physically altered, metal multi-purpose plates shall be mounted adjacent to the metal certification plate readily accessible for inspection. The mounting of the plates shall be such that only the plate identifying the applicable specification is legible at all times the cargo tank is in complete compliance with such specifications. The mounting of the plates (or plate assembly) shall be secured in such a manner as to be capable of retaining the plate when subjected to normal operating conditions. The same marking size and method used on the certification plate shall be used. The plate shall contain at least the information contained below:

SPECIFICATION IDENTIFICATION MC _____
EQUIPMENT NECESSARY

Vents	Quantity[1]
Pressure actuated	
Fusible	
Frangible	
Product discharge	
Top	
Bottom	
Pressure unloading fitting	
Covers	
Manhole	
Fill opening	

[1] The number required to meet applicable specification. If no physical change is required the letters NC shall follow the number required. If cargo tank is not so equipped the word "NONE" shall be inserted.

(i) Color coding: Those parts which must be changed or added to meet the applicable specification requirements and the appropriate multi-purpose plate shall be identified using the following colors:

MC 306 RED
MC 307 GREEN
MC 312 YELLOW
Non Spec. BLUE

Additionally those parts to be changed or added shall be stamped with appropriate MC Spec. Number _____.

(c) **Manufacturer's certificate.** A certificate signed by a responsible official of the manufacturer of the cargo tank, or from a competent testing agency, certifying that each such cargo tank is designed, constructed and tested in accordance and complies with the requirements contained in the applicable specification shall be procured, and such certificate shall be retained in the files of the carrier during the time that such cargo tank is employed by him plus one year. In lieu of this certificate, if the motor carrier himself elects to ascertain that any such tank fulfills the requirements of the specification by his own test, he shall similarly retain the test data.

---

§ 178.341 Specification MC 306; cargo tanks.

§ 178.341-1 General requirements. (a) Specification MC 306 cargo tanks must comply with the general design and construction requirements in § 178.340 in addition to the specific requirements contained in this section.

(b) **Design pressure.** The design pressure of each cargo tank shall not be less than that pressure exerted by the static head of the fully loaded tank in the upright position.

§ 178.341-2 Thickness of shells, heads, bulkheads and baffles. (a) **Material thickness.** The minimum thicknesses of tank material authorized in § 178.340-3 shall be predicated on not exceeding the maximum allowable stress level (§ 178.340-4(a)) but in no case less than those indicated in Tables I and II below:

Maximum Shell Radius

Maximum Shell Radius

TABLE II—MINIMUM THICKNESS OF HEADS, BULKHEADS AND BAFFLES
(Mild Steel (MS), High Strength Low Alloy Steel (HSLA), Austenitic Stainless Steel (SS) in United States Standard Gauge—Aluminum Alloy (AL)—expressed in decimals of an inch)

(l) Product density. The material thicknesses contained in Tables I and II are minimums based on a maximum 7.2 pounds per gallon product weight. If the tank is designed to haul products weighing more than 7.2 pounds per gallon, the gallon per inch value used to determine the minimum thickness of heads, bulkheads, baffles or shell sheets shall be the actual section capacity required in gallons per inch multiplied by the actual product density in pounds per gallon divided by 7.2.

§ 178.341-3 Closures for fill openings and manholes. (a) Each compartment in excess of 2500 gallons capacity shall be accessible through a manhole of at least 11 inches x 15 inches. Manhole and or fill opening covers shall be designed to provide secure closure of the openings. They shall have structural capability of withstanding internal fluid pressures of 9 psig without permanent deformation. Safety devices to prevent the manhole and or fill cover from opening fully when internal pressure is present shall be provided.

§ 178.341-4 Vents. (a) Each cargo tank compartment shall be provided with safety relief devices in accordance with the requirements contained in this paragraph. All of such devices shall communicate with the vapor space. Shut-off values shall not be installed between the tank opening and any safety device. Safety relief devices shall be so mounted, shielded or drained as to eliminate the accumulation of water, the freezing of which could impair the operation or discharge capability of the device.

(b) Normal venting. Each cargo tank compartment shall be provided with pressure and vacuum vents having a minimum through area of 0.44 square inch. All pressure vents shall be set to open at no more than 1 psig and all vacuum vents at no more than 6 ounces. Pressure and vacuum vents shall be designed to prevent loss of liquid through the vent in case of vehicle overturn.

(c) Loading and unloading venting protection. If the tank is designed to be loaded or unloaded with the dome cover closed, the vent or vents as described in paragraph (b) of this subsection or additional vents shall limit the vacuum to one psi and the tank pressure to 3 psig based on maximum product transfer rate to be included on the metal certification plate § 178.340-10(b). Unless effective protection against overfilling is made, the pressure vent shall also have sufficient liquid capacity to prevent the pressure from exceeding 3 psig in case of accidental overfilling. This pressure vent may be pressure operated or interlocked with the tank loading device, and shall be designed to prevent loss of liquid through the vent under any condition of vehicle rollover attitude.

(d) Emergency venting for fire exposure.

(1) Total capacity. The total emergency venting capacity (cu. ft/hr) of each cargo tank compartment shall be not less than that determined from Table III.

(2) Pressure-actuated venting. Each cargo tank compartment shall be equipped with pressure-actuated vent or vents set to open at not less than 3 psig and close when pressure drops to 3 psig or below. The minimum venting capacity for pressure actuated vents shall be 6,000 cubic feet of free air per hour (14.7 psia and 60° F) from a tank pressure of 5 psig. Pressure-actuated devices shall be designed so as to prevent leakage of liquid past the device in case of surge or vehicle upset, except that they shall function in case of pressure rise under any condition of vehicle rollover attitude.

(3) Fusible venting. If the pressure-actuated venting required by paragraph (d)(2) of this subsection does not provide the total venting capacity required by paragraph (d)(1) of this subsection additional capacity shall be provided by adding fusible venting devices each having a minimum area of 1.25 square inches, such fusible elements shall be so located as to not be in contact with the tank lading under normal operating conditions. The fusible vent or vents shall be actuated by elements which operate at a temperature not exceeding 250° F. The venting capacity of these devices shall be rated at not more than 5 psig.

TABLE III
MINIMUM EMERGENCY VENT CAPACITY IN CUBIC FEET FREE AIR/HOUR (14.7 PSIA and 60°F)

Exposed area square feet	Cubic feet free air per hour	Exposed area square feet	Cubic feet per air per hour
20	15,800	275	214,300
30	23,700	300	225,100
40	31,600	350	245,700
50	39,500	400	265,000
60	47,400	450	283,200
70	55,300	500	300,600
80	63,300	550	317,300
90	71,200	600	333,300
100	79,100	650	348,800
120	94,900	700	363,700
140	110,700	750	378,200
150	126,500	800	392,200
180	142,300	850	405,900
200	158,100	900	419,300
225	191,300	950	432,300
250	203,100	1,000	445,000

Note 1: Interpolate for intermediate sizes.

(e) Flow testing and marking of vents. Each type and size of venting devices shall be flow tested in the ranges specified in the applicable preceding paragraphs. The actual rated flow capacity of the vent in cubic feet of free air per hour at the pressure in psig at which the flow capacity is determined shall be stamped on the device. The fusible vent or vents shall have their flow rating determined at 5 psig differential.

(f) These flow tests may be conducted by the manufacturer or may be delegated to a certified outside agency.

§ 178.341-5 Emergency flow control. (a) Each product discharge opening shall be equipped with a self-closing shut off valve, designed, installed, and protected in accordance with § 178.340-8(d) and operated so as to assure against the accidental escape of contents. These valves shall be located inside the tank or at a point outside the tank where the line enters or leaves the tank. The valve seat shall be located inside the tank or within the welded flange, its companion flange, nozzle, or coupling. Such product discharge valves (outflow) shall, in addition to normal means, be closed by (1) an automatic heat actuated means which will become effective at a temperature not over 250° F., (2) a secondary closing means, remote from tank filling or discharge openings, for operation in event of fire or other accident.

§ 178.341-6 Gauging devices. (a) No applicable provisions.

§ 178.341-7 Method of test. (a) Test for leaks. Every cargo tank shall be tested by a minimum air or hydrostatic pressure of 3 psig or at least equal to the tank design pressure of § 178.341-1(b) whichever is greater applied to the whole tank and dome if it be non-compartmented. If compartmented each individual compartment shall be similarly tested with adjacent compartments empty and at atmospheric pressure. Air pressure, if used, shall be held for a period of at least five minutes during which the entire surface of all joints under pressure shall be coated with a solution of soap and water, heavy oil, or other material suitable for the purpose, foaming or bubbling of which indicates the presence of leaks. Hydrostatic pressure, if used, shall be done by using water or other liquid having a similar viscosity, the temperature of which shall not exceed 100° F. during the test, and applying pressure as prescribed above,

gauged at the top of the tank, at which time all joints under pressure shall be inspected for the issuance of liquid to indicate leaks. All closures shall be in place while test by either method is made. During these tests, operative relief devices shall be clamped, plugged, or otherwise rendered inoperative; such clamps, plugs, and similar devices shall be removed immediately after the test is finished. Any leakage discovered by either of the methods above described, or by any other method, shall be deemed evidence of failure to meet the requirements of this specification. Tanks failing to pass this test shall be suitably repaired, and the above described tests shall be continued until no leaks are discovered, before any cargo tank is put into service.

(b) **Test for distortion or failure.** Every cargo tank shall be tested by pressures prescribed in paragraph (a) of this section and shall withstand such pressure without undue distortion, evidence of impending failure or failure. Failure to meet this requirement shall be deemed as sufficient cause for rejection under this specification. If there is undue distortion, or if failure impends or occurs, the cargo tank shall not be placed in or returned to service unless an adequate repair is made. The adequacy of the repair shall be determined by the same method of test.

§ 178.342 Specification MC 307; cargo tanks.

§ 178.342-1 General requirements. (a) Specification MC 307 cargo tanks must comply with the general design and construction requirements in § 178.340, in addition to the specific design requirements contained in this section.

(b) The design pressure (maximum allowable working pressure) of each cargo tank shall be not less than 25 psig. For working pressures in excess of 50 p.s.i.g. the tank must be designed in accordance with the requirements of the ASME Code.

(c) Tanks shall be of circular cross-section.

§ 178.342-2 Thickness of shell, heads, bulkheads, and baffles. (a) **Material thickness.** The minimum thicknesses of tank material authorized in § 178.340-3 shall be not less than those obtained by applying the following formulas nor less than those specified in Tables I and II below:

$$\text{Thickness of shell} = T_s = \frac{PD}{2SE_s}$$

$$\text{Thickness of heads} = T_h = \frac{.0885PL}{SE_h} \text{ (for pressure on concave side only)}$$

where:

T_s = Minimum thickness of shell material, exclusive of allowance for corrosion or other loadings;
T_h = Minimum thickness of head material, after forming, exclusive of allowance for corrosion and other loadings;
P = Design pressure, pounds per square inch;
D = Inside diameter of shell, inches;
L = Inside crown radius of head, inches;
S = Maximum allowable stress value, pounds per square inch equals one-fourth of specified minimum ultimate tensile strength. (One-fourth of aluminum alloy's annealed minimum ultimate strength.);
E_s = Lowest efficiency of any longitudinal joint in shell. (85% max.);
E_h = Lowest efficiency of any joint in head. (85% max.).

TABLE I—MINIMUM THICKNESS OF HEADS, BULKHEADS, AND BAFFLES

54" thru 60"	14	15	.109	13	14	.130	12	13	.151	11	12	.173	10	11	.194	9	10	.216	8	9	.237

(1) The knuckle radius of the head shall not be less than three times the material thickness. The straight flange shall not be less than three times the material thickness for butt-welded heads.

(2) For heads with pressure on the convex side, the material thickness as obtained by the above formula shall be increased by 67% unless such heads are adequately braced to prevent excessive distortion.

(b) **Corrosion allowance.** Vessels or part of vessels subject to thinning by corrosion, erosion or mechanical abrasion, shall have provision made to withstand the intended life and service by a suitable increase in the thickness of the material over that determined by the design formulas, or by using some other suitable method of protection. Material added for these purposes need not be of the same thickness for all parts of the vessel if different rates of attack are expected for the various parts.

§ 178.342-3 Closures for manholes. (a) Each compartment shall be accessible through a 15 inch minimum inside diameter manhole. The manhole cover shall be designed to provide a secure closure of the manhole. All joints between manhole covers and their seats shall be made tight against leakage of vapor and liquid. Gaskets, if used, shall be of suitable material not subject to attack by lading.

(1) Closures shall have structural capability of withstanding internal fluid pressures of 40 psig or one and one-half times the design pressure of the tank whichever is greater without permanent deformation. Safety devices to prevent the manhole and/or fill cover from opening fully when internal pressure is present shall be provided.

§ 178.342-4 Vents. (a) Each cargo tank compartment shall be provided with safety relief devices in accordance with the requirements contained in this paragraph. All of such devices shall communicate with the vapor space. Shut-off valves shall not be installed between the tank opening and any safety device. Safety relief devices shall be so mounted, shielded or drained as to eliminate the accumulation of water, the freezing of which could impair the operation or discharge capability of the device.

(b) **Total capacity.** Every cargo tank compartment shall be provided with one or more devices with sufficient capacity to limit the tank internal pressure to a maximum of 130% of the tank design pressure. This total venting capacity shall be not less than that determined from Table III, using the external surface of the cargo tank or tank compartment as the exposed area.

(c) **Pressure-actuated venting (spring loaded).** Every cargo tank compartment shall be equipped with pressure-actuated vent or vents set to open at not less than the tank design pressure. The minimum venting capacity for pressure actuated vents shall be 12,000 cubic feet of free air per hour (14.7 psia and 60° F.) per compartment or 12,000 cubic feet of free air per hour (14.7 psia and 60° F.) for each 350 square feet of exposed tank area, whichever is greater. This minimum capacity shall be measured at a pressure of 130% of the tank design pressure. Pressure actuated devices shall be designed to function in case of pressure rise when in any condition of roll over attitude. If pressure (maximum limits to be included on the metal certification plate § 178.340-10(b)) unloading devices are provided, the relief valve shall have sufficient capacity to limit the tank internal pressure to 130% of design pressure.

(d) **Fusible and frangible venting.** If the pressure-actuated venting required by paragraph (c) of this subsection does not provide the total venting capacity required by paragraph (b) of this subsection, additional capacity shall be provided by adding fusible and/or frangible venting devices. Each fusible device shall have a minimum area of 1.25 square inches and shall be actuated by elements which operate at a temperature not exceeding 250° F. when the tank pressure is between

the tank design pressure and 130% of the tank design pressure. Such fusible elements shall be so located as to not be in contact with the lading under normal operating conditions. The bursting pressure of frangible devices shall be not less than 130% nor more than 150% of the tank design pressure.

TABLE III

MINIMUM EMERGENCY VENT CAPACITY IN CUBIC FEET FREE AIR HOUR (14.7 PSIA and 60°F)

Exposed area square feet	Cubic feet free air per hour	Exposed area square feet	Cubic feet free air per hour
20	15,900	275	214,300
30	23,700	300	225,100
40	31,600	350	245,700
50	39,500	400	265,000
60	47,400	450	283,200
70	55,300	500	300,500
80	63,300	550	317,300
90	71,200	600	333,300
100	79,100	650	348,900
120	94,900	700	363,700
140	110,700	750	378,200
150	126,500	800	392,200
160	142,300	850	405,900
200	158,100	900	419,300
225	191,300	950	432,300
250	203,100	1,000	445,000

Note 1. Interpolate for intermediate sizes

(e) **Flow testing and marking of vents.** Each type and size of venting devices shall be flow tested in the ranges specified in the applicable preceding paragraphs. The actual rated flow capacity of the vent in cubic feet of free air per hour at the pressure in psig at which the flow capacity is determined shall be stamped on the device.

(1) These flow tests may be conducted by the manufacturer or may be delegated to a certified agency.

§ 178.342-5 Outlets. (a) Each product discharge opening shall be equipped with a self-closing shut off valve, designed, installed, and protected in accordance with § 178.340-8(d) and operated so as to assure against the accidental escape of contents. These valves shall be located inside the tank or within the welded flange, its companion flange, nozzle, or coupling. Such product discharge valves (outflow) shall, in addition to normal means, be closed by (1) an automatic heat actuated means which will become effective at a temperature not over 250° F, (2) a secondary closing means, remote from tank filling or discharge openings, for operation in event of fire or other accident.

(b) Vapor return lines, if used, may be equipped with an excess flow valve at the tank connection if a positive shut-off valve is provided between the excess-flow valve and the hose connection.

§ 178.342-6 Gauging devices. (a) **Gauge device design.** Every tank compartment except tanks filled by weight, shall be equipped with one or more gauging device which shall indicate accurately the maximum permitted liquid level in each compartment. Additional gauging devices may be installed but may not be used as primary controls for filling of cargo tanks at pressures above atmospheric. Acceptable gauging devices for use at pressures above atmospheric are the rotary tube, the adjustable slip tube and the fixed length dip tube. Gauge glasses are not permitted to be installed on any cargo tank.

(b) **Fixed level indicators.** All liquid level gauging devices, except those on tanks provided with fixed maximum level indicators, shall be legibly and permanently marked in increments of not more than 20° F. to indicate the maximum levels to which the tank may be filled with liquid at temperatures above 20° F. In the event that it is impractical to put these markings on the gauging device, this information shall be marked on a suitable plate affixed to the tank in a location adjacent to the gauging device.

(c) **Dip tubes.** A fixed length dip tube gauging device, when used, shall consist of a dip pipe of small diameter equipped with a valve at the outer end, and extending into the tank to a specified fixed length. On horizontally-mounted cylindrical tanks, the fixed length to which the tube extends into the tank shall be such that the device will function to indicate when the liquid reaches the maximum level permitted by these regulations.

§ 178.342-7 Method of test. (a) **Test pressure.** The standard test pressure for each required test shall be 40 psig or a minimum of 1.5 times design pressure whichever is greater.

(b) **Method of test.** Every cargo tank shall be tested by complete filling (including domes if any) with water or other liquid having a similar viscosity and applying a pressure of not less than the standard test pressure specified in paragraph (a) of this subsection. The pressure shall be gauged at the top of the tank. The tank shall hold the prescribed pressure for at least 10 minutes. All tank accessories shall be leakage tested after installation and proved tight at not less than the design pressure of the tank, except that hose used on such tanks may be tested either before or after installation. Failure to successfully meet the test criteria shall be deemed evidence of failure to meet the requirements of this specification. Tanks failing to pass this test shall be suitably repaired. The suitability of the repair shall be determined by the same method of test.

(i) **When divided into compartments.** When the interior of the tank is divided into compartments, each compartment shall be tested as a separate tank with adjacent compartments empty and at atmospheric pressure.

---

§ 178.343 Specification MC 312; cargo tanks.

§ 178.343-1 General requirements. (a) Specification MC 312 cargo tanks must comply with the general design and construction requirements in § 178.340 in addition to the specific requirements contained in this section.

(b) **Tank design.** Cargo tanks built under this specification that are unloaded by pressure in excess of 15 p.s.i.g. must be designed and constructed in accordance with and fulfill all requirements of the ASME Code. No tank shall have head, bulkhead, and baffle or shell thicknesses less than that specified in § 178.343-2, Tables I and II, nor shall the spacing of bulkheads, baffles or shell stiffeners exceed that specified in § 178.340-7.

(c) Design pressure shall be not less than pressure used for unloading.

§ 178.343-2 Thickness of shell, heads, bulkheads and baffles of non-ASME Code tanks. (a) **Material thickness.** The minimum thicknesses of tank material authorized in § 178.340-3 shall be predicated on not exceeding the maximum allowable stress level in § 178.340-4(a) but in no case less than those indicated in Tables I and II listed below, or the accompanying aluminum alloy formula:

	54" Thru 60"	8	1/4	1/4	3/16	1/4	5/16	3/16	1/4	5/16	1/4	5/16	3/8

$$\text{Thickness of Aluminum Alloy Materials} = \text{Thickness of Steel from Tables I \& II} \times \frac{3 \times 10^7}{E}$$

Where E = Modulus of Elasticity of the material to be used.

(b) Lining. Except as provided in paragraph (c) of this subsection, cargo tanks shall be lined and the material used for lining each cargo tank subject to this specification shall be homogenous, nonporous, imperforate when applied, not less elastic than the metal of the tank proper, and substantially immune to attack by the commodities to be transported therein. It shall be directly bonded or attached by other equally satisfactory means. Joints and seams in the lining shall be made by fusing the material together, or by other equally satisfactory means.

(c) Conditions under which tanks need not be lined. Tanks need not be lined as provided in paragraph (b) of this subsection, if:

(1) The material of the tank is substantially immune to attack by the materials to be transported therein; or,

(2) The material of the tank is thick enough to withstand 10 years normal service without being reduced at any point to less thickness than that specified in paragraph (a) of this subsection corresponding to its type; or,

(3) The chemical reaction between the material of the tank and the commodity to be transported therein is such as to allow the tank to be properly passivated or neutralized and if the tank is not frequently cleaned and not used in the transportation of other commodities.

§ 178.343-3 Closure for manholes. (a) Each compartment shall be accessible through a manhole conforming to paragraph UG-46(g)(1) of the ASME Code. The manhole cover shall be designed to provide a secure closure of the manhole. All joints between manhole covers and their seats shall be tight against leakage of vapor and liquid. Gaskets, if used, shall be of suitable material not subject to attack by lading.

(1) The manhole cover shall have structural capability of withstanding internal fluid pressures equal to one and one-half times the design pressure of the tank and in no case less than 15 psig without permanent deformation. Safety devices to prevent the manhole and or fill cover from opening fully when internal pressure is present shall be provided.

§ 178.343-4 Vents. (a) Safety vent. Every cargo tank compartment shall be equipped with suitable pressure relief devices as required by the ASME Code, or shall be fitted with suitable rupture discs in lieu of mechanical pressure relief valves. Such discs shall be designed to rupture at not to exceed one and one-half times the design pressure of the tank. If air inlet devices are provided a relief valve shall have adequate capacity to limit tank pressure to 130% of design pressure at maximum inlet flow rate. Such maximum limits to be included on the metal certification plate § 178.340-10(b) Air inlet lines if permanently connected to an air source shall be equipped with a check valve. Shut-off valves between the tank and relief valve or rupture disc are prohibited.

§ 178.343-5 Outlets. (a) Each outlet at or near the top of a tank, used for discharge of lading, must be equipped with a shutoff valve located as close as practical to the point of outlet from the tank. Each such outlet having its discharge end below the top liquid level in the tank must be equipped with an additional shutoff valve, blank flange, or sealing cap at the discharge end of the outlet.

(b) Except as provided in paragraphs (c) and (d), of this section; each bottom outlet must be equipped with a shutoff valve designed, installed, and protected as follows:

(1) Product piping must be protected in such a manner as to reasonably assure against the accidental escape of contents. Such protection must be provided by:

(i) A shear section located out-board of each valve seat and within 4 inches of the vessel which will break under strain and leave the valve seat and its attachment to the vessel and the valve head intact and capable of retaining product. The shear action shall be machined in such a manner as to abruptly reduce the wall thickness of the adjacent piping (or valve) material by at least 20 percent; or

(ii) By suitable guards capable of absorbing a concentrated horizontal force of at least 8,000 pounds applied from any horizontal direction, without damage to the discharge piping which will adversely affect the product retention integrity of the discharge valve.

(2) Each bottom outlet valve must be located inside the tank or immediately adjacent at the outlet point outside the tank.

(i) The valve seat must be located inside the tank or within the welded flange, its companion flange, nozzle, or coupling at the point of outlet from the tank.

(ii) Each bottom discharge valve must be equipped with a remote means to activate a valve closure manually from a point no less than 10 feet away.

(3) In addition, a blank flange, sealing cap, or shutoff valve is required at the discharge end of the outlet.

(c) A bottom opening for purposes other than lading discharge may be closed by a bolted blank flange at the tank shell. If any piping extends from such an opening, it must be fitted with a shutoff valve designed, installed, and protected as described in paragraph (b)(1) of this section. In addition a supplemental closure is required at the discharge end of this piping.

(d) Bottom outlet valves need not meet subparagraph (b)(2)(ii) of this section when the cargo tank is transporting a corrosive liquid containing solids in suspension in sufficient quantity that settling may form a layer of solid material that may interfere with seating of the valve seat.

§ 178.343-6 Gauging devices. (a) No applicable requirement.

§ 178.343-7 Method of test. (a) Test for leaks. Every cargo tank shall be tested by completely filling the tank and dome with water or other liquid having a similar viscosity, the temperature of which shall not exceed 100° F during the test, and applying a pressure of one and one-half times the design pressure but not less than 3 psig. The pressure shall be gauged at the top of the tank. The tank shall hold the prescribed pressure for at least ten minutes without failure, undue distortion, leakage or evidence of impending failure. All closures shall be in place while test is made. During these tests, operative relief devices shall be clamped, plugged or otherwise rendered inoperative; such clamps, plugs and similar devices shall be removed immediately after the test is finished.

(b) Test for distortion or failure. Every cargo tank shall be tested by the pressures prescribed in paragraph (a) of this subsection and shall withstand such pressures without undue distortion or other indication of

impending failure. If there is undue distortion, or if failure impends or occurs, the cargo tank shall not be placed in or returned to service unless an adequate repair is made. The adequacy of the repair shall be determined by the same method of test.

(c) Test of heating system. After an interior heating system consisting of coil piping is installed, and before the tanks to which they are fitted are placed in service, the heating system shall be tested. Systems employing media such as steam or hot water under pressure for heating the contents of cargo tanks shall be tested with hydrostatic pressure and proved to be tight at 200 psig.

SUBPART K

SPECIFICATIONS FOR GENERAL PACKAGINGS

§ 178.350 Specification 7A; general packaging Type A.

§ 178.350-1 General requirements. (a) Each packaging must meet all applicable requirements of § 173.24.

§ 178.350-2 Specific requirements. (a) Each packaging must be so designed and constructed that it meets the standards for Type A packaging (see §§ 173.403 and 173.465.

§ 178.350-3 Marking. (a) Marking on the outside of each packaging as follows: "USA DOT-7A Type A" and "Radioactive Material."

(b) The letter and number size and additional marking requirements of § 173.24 of this subchapter must be complied with.

APPENDICES TO PART 178

Appendix A—Specifications for Steel

Table 1

Open hearth, basic oxygen, or electric steel of uniform quality
The following chemical composition limits are based on ladle analysis

Designation	Chemical composition, percent ladle analysis		
	Grade 1[1]	Grade 2 [2,3]	Grade 3[2,4]
Carbon	0.10-0.20	0.24 maximum	0.22 maximum
Manganese	1.10-1.60	0.50-1.00	1.25 maximum
Phosphorus, maximum	0.04	0.04	0.045[5]
Sulfur, maximum	0.05	0.05	0.05
Silicon	0.15-0.30	0.30 maximum	
Copper, maximum	0.40		
Columbium		0.01-0.04	
Heat treatment authorized	(6)	(6)	(3)
Maximum stress (p.s.i.)	35,000	35,000	35,000

[1] Addition of other elements to obtain alloying effect is not authorized.
[2] Ferritic grain size 6 or finer according to ASTM E112-63.
[3] Any suitable heat treatment in excess of 1,100° F., except that liquid quenching is not permitted.
[4] Other alloying elements may be added and shall be reported.
[5] For compositions with a maximum carbon content of 0.15 percent on ladle analysis, the maximum limit for manganese on ladle analysis may be 1.40 percent.
[6] Rephosphorized Grade 3 steels containing no more than 0.15 percent phosphorus are permitted if carbon content does not exceed 0.15 percent and manganese does not exceed 1 percent.

Check Analysis Tolerances

A heat of steel made under any of the above grades, the ladle analysis of which is slightly out of the specified range, is acceptable if the check analysis is with the following variations:

Element	Limit or maximum specified (percent)	Tolerance (percent) over the maximum limit or under the minimum limit	
		Under minimum limit	Over maximum limit
Carbon	To 0.15 inclusive	0.02	0.03
	Over 0.15 to 0.40 inclusive	0.03	0.04
Manganese	To 0.60 inclusive	0.03	0.03
	Over 0.60 to 1.5 inclusive	0.04	0.04
	Over 1.15 to 2.50 inclusive	0.05	0.05
Phosphorus[7]	All ranges		0.01
Sulfur	All ranges		0.01
Silicon	To 0.30 inclusive	0.02	0.03
	Over 0.30 to 1.00 inclusive	0.05	0.05
Copper	To 1.00 inclusive	0.03	0.03
	Over 1.00 to 2.00 inclusive	0.05	0.05
Nickel	To 1.00 inclusive	0.03	0.03
	Over 1.00 to 2.00 inclusive	0.05	0.05
Chromium	To 0.90 inclusive	0.03	0.03
	Over 0.90 to 2.10 inclusive	0.05	0.05
Molybdenum	To 0.20 inclusive	0.01	0.01
	Over 0.20 to 0.40 inclusive	0.02	0.02
Zirconium	All ranges	0.01	0.05
Columbium	To 0.04 inclusive	0.005	0.01
Aluminum	Over 0.10 to 0.20 inclusive	0.04	0.04
	Over 0.20 to 0.30 inclusive	0.05	0.05

[7] Rephosphorized steels not subject to check analysis for phosphorus.

PART 179—SPECIFICATIONS FOR TANK CARS

SUBPART A

INTRODUCTION, APPROVALS AND REPORTS

§ 179.1 General. (a) This part prescribes the specifications for tanks that are to be mounted on or form part of a tank car and which are used for the transportation of hazardous materials in commerce.

(b) Except as provided in paragraph (c) of this section, tanks to which this part is applicable, must be built to the specifications prescribed in this part.

(c) Tanks built to specifications predating those in this part may continue in use as provided in §173.31 of this subchapter.

(d) Any person who performs a function prescribed in this part, shall perform that function in accordance with this part.

(e) When this part requires a tank to be marked with a DOT specification (for example, DOT-105A100W), compliance with that requirement is the responsibility of the tank builder. Marking the tank with the DOT specification shall be understood to certify compliance by the builder that the functions performed by the builder, as prescribed in this part, have been performed in compliance with this part.

(f) The tank builder should inform each person to whom that tank is transferred of any specification requirements which have not been met at time of transfer.

§ 179.2 Definitions and abbreviations. (a) The following apply in Part 179:

(1) "AAR" means Association of American Railroads.
(2) "Approved" means approval by the AAR Committee on Tank Cars.
(3) "ASTM" means American Society for Testing and Materials.
(4) "DOT" and "Department" means Department of Transportation.
(5) Definitions in Part 173 of this chapter also apply.
(6) "F" means degrees Fahrenheit.
(7) "NGT" means National Gas Taper Threads.
(8) "NPT" means American Standard Taper Pipe Thread.
(9) "Psi" means pounds per square inch gauge.
(10) "Tanks" means tank car tanks.

§ 179.3 Procedure for securing approval. (a) Application for approval of designs, materials and construction, conversion or alteration of tank car tanks under these specifications, complete with detailed prints, shall be submitted in prescribed form to the Secretary, Mechanical Division, AAR, for consideration by its Committee on Tank Cars and other appropriate committees. Approvals or rejections of applications, based on appropriate committee action, shall be issued by said Secretary.

(b) When, in the opinion of the Committee, such tanks or equipment therefor are in compliance with effective regulations and specifications of the Department, the application will be approved.

(c) When, in the opinion of the Committee, such tanks or equipment therefor are not in compliance with effective regulations and specifications of the Department, the Committee may recommend service trials to determine the merits of a change in specifications. Such service trials may be authorized by the Department under the terms of exemptions.

§ 179.4 Changes in specifications for tank cars. (a) Proposed changes in or additions to specifications for tanks shall be submitted to the Secretary, Mechanical Division, AAR, for consideration by its Committee on Tank Cars. An application for construction of tanks to any new specification may be submitted with proposed specification. Construction should not be started until the specification has been approved or exemptions has been issued. When proposing a new specification, the applicant shall furnish information to justify a new specification. This data should include the properties of the lading and the method of loading and unloading.

(b) The Subcommittee on Specifications of the Committee on Tank Cars shall review the proposed specifications at its earliest convenience and report its recommendations to the Committee on Tank Cars for prompt consideration. The Committee on Tank Cars shall report its recommendations through said Secretary to the Department; such reports may be submitted to the Bureau of Explosives for its recommendation before action by the Department. Expert opinion thus obtained will be given due consideration by the Department in determining appropriate action.

§ 179.5 Certificate of construction. (a) Except as provided in paragraph (b) of this section, before a tank car is placed in service, the party assembling the completed car shall furnish a Certificate of Construction, Form AAR 4-2 to the owner, the Bureau of Explosives (as required by §179.5(d)), and the Secretary, Mechanical Division, AAR, certifying that the tank, equipment, and car completed comply with all the requirements of the specification.

(b) Before a tank of Class DOT-106A, 107A, or 110A is placed in service, the builder must furnish a Certificate of Construction, Form AAR 4-2 to the owner, the Bureau of Explosives (as required by paragraph (d) of this section), and the Secretary, Mechanical Division, AAR, in addition to a Certificate of Inspector's Report as required in §179.300-20 and §179.500-18 in prescribed form certifying that the tank and appurtenances comply with all the requirements of the specifications.

(c) If the owner elects to furnish the appurtenances such as valves and safety devices, the owner shall furnish to the Bureau of Explosives, and to the Secretary, Mechanical Division, AAR, a report in prescribed form, certifying that the appurtenances comply with all the requirements of the specifications.

(d) When cars or tanks which are covered on one application and are identical in all details are built in series, one certificate shall suffice for each series when submitted to the Secretary. One copy of the Certificate of Construction must be furnished to the Bureau of Explosives for each car number of consecutively numbered group or groups covered by the original application.

§ 179.6 Repairs and alterations. For procedure to be followed in making repairs or alterations, see Appendix R of the AAR Specifications for Tank Cars.

[1] Use of existing tank cars authorized, but new construction not authorized.

SUBPART B

GENERAL DESIGN REQUIREMENTS

§ 179.10 Tank mounting. (a) The manner in which tanks are attached to the car structure shall be approved. The use of rivets to secure anchors to tanks prohibited.

§ 179.11 Welding certification. (a) Welding procedures, welders and fabricators shall be approved.

§ 179.12 Interior heater systems.

§ 179.12-1 General. (a) Interior heater systems shall be of approved design and materials. If a tank is divided into compartments, a separate system shall be provided for each compartment.

§ 179.12-2 Materials and dimensions. (a) Interior heater systems and plug flanges, if welded to tank or dome, shall be cast, forged or fabricated metal, and be of good weldable quality in conjunction with metal of tank or dome.

(b) Piping must be not less than 2 inches IPS. Tubing must be not less than 2⅜ inches outside diameter and the wall thickness must be at least equivalent to the corresponding pipe size. Material specifications and nominal wall thickness must be as follows:

Material	Nominal thickness minimum[1]		Specifications ASTM
	2 inches	Over 2 inches	
Carbon steel	0.175	Schedule 40	A-53-69a, A-192-69, A-178-70
Alloy steel	Schedule 40S	Schedule 40S	A-312-70, A-269-69
Aluminum	Schedule 80	Schedule 80	B-241-69, B-210-70, B-221-69
Nickel	Schedule 40	Schedule 40	B-161-70

[1] Thickness must be increased 25 percent or to next higher schedule, whichever is less, when threaded joints are used.

(c) Systems may be fabricated of other materials and of other than circular cross section, if approved.

§ 179.12-3 Joints and fittings. (a) Welded butt joints are preferable. Bolted joints with flange welded to piping may be used if welding is not feasible or to facilitate tank cleaning or application of linings. Return bends shall be forged or made by bending the pipe. Cast, forged or fabricated manifolds of approved design may be used.

(b) Inlets and outlets of heater systems shall be equipped with valve cock, cap or plug. Caps and plugs shall be secured by chain.

§ 179.12-4 Application to tank. (a) Interior heater systems shall be so constructed that the breaking off of their external connections will not cause leakage of contents of tank.

(b) Inlets and outlets may be located in any portion of dome, shell, heads, or stream jacketed outlet provided proper drainage of heater system is accomplished.

(c) If ends of coils are not attached to a manifold or steam jacketed outlet, they shall be attached to pads or reinforcements. Such reinforcements must be attached to tank in compliance with the requirements of the tank specification.

(1) Outside pipe connections to steam coils shall not be an integral part of the interior coils and shall be screwed or welded, or both, into outside of pads or reinforcements.

(d) All piping shall be secured so as to permit necessary expansion and contraction.

§ 179.12-5 Tests. (a) Each interior heater system shall be hydrostatically tested at not less than 200 psi. and shall hold the pressure for 10 minutes without leakage or evidence of distress.

§ 179.12-6 Reports. (a) The Certificate of Construction for the completed car shall indicate installation of interior heater system and date of initial hydrostatic test.

§ 179.12-7 Stenciling. (a) To indicate that tank is equipped with interior heater system, the tank, or the jacket if tank is insulated, shall be stenciled in compliance with the applicable requirements of AAR Specifications for Tank Cars, Appendix C.

§ 179.13 Tank car capacity and gross weight limitation. Tank cars built after November 30, 1970, must not exceed 34,500 gallons capacity or 263,000 pounds gross weight on rail. Existing tank cars may not be converted to exceed 34,500 gallons capacity or 263,000 pounds gross weight on rail.

§ 179.14 Tank car couplers. (a) All tank cars built after January 1, 1971, must be equipped with interlocking automatic couplers that will resist car telescoping and jackknifing in derailments and in emergency stops, and that have been approved by the Federal Railroad Administrator.

(1) Effective November 9, 1977, couplers designated by the Association of American Railroads Catalog Nos. SE60CHT, SE60CHTE, SF70CHT and SF70CHTE are approved.

(2) Effective January 1, 1978, couplers designated by the Association of American Railroads' Catalog Nos. SE67BHT, SE67BHTE, SE68BHT, SE68BHTE, SF73AHT, SF73AHTE, SF79CHT, and SF79CHTE are approved.

SUBPART C

SPECIFICATIONS FOR PRESSURE TANK CAR TANKS (CLASSES DOT-105, 109, 112, AND 114)

§ 179.100 General specifications applicable to pressure tank car tanks.

§ 179.100-1 Tanks built under these specifications shall comply with the requirements of § 179.100, § 179.101, and when applicable, §§ 179.102, 179.103, and 179.104.

§ 179.100-2 Approval. (a) For procedure for securing approval see § 179 3.

§ 179.100-3 Type. (a) Tanks built under this specification shall be fusion-welded with heads designed convex outward. Except as provided in § 179.103 or 179.104, they shall be circular in cross section, shall be provided with a manway nozzle on top of the tank of sufficient size to permit access to the interior, a manway cover to provide for the mounting of all valves, measuring and sampling devices, and a protective housing. Other openings in the tank are prohibited, except as provided in Part 173 of this chapter, §§ 179.100-14, 179.101-1(a) Table Note 10, 179.102 or 179.103.

§ 179.100-4 Insulation. (a) If insulation is applied, the tank shell and manway nozzle must be insulated with an approved material. The entire insulation must be covered with a metal jacket of a thickness not less than 11 gage (0.1196 inch) nominal (Manufacturers' Standard Gage) and flashed around all openings so as to be weathertight. The exterior surface of a carbon steel tank, and the inside surface of a carbon steel jacket must be given a protective coating except that a protective coating is not required when foam-in-place insulation that adheres to the tank or jacket is applied.

(b) If insulation is a specification requirement, it shall be of sufficient thickness so that the thermal conductance at 60° F. is not more than 0.075 Btu. per hour, per square foot, per degree F. temperature differential. If exterior heaters are attached to tank, the thickness of the insulation over each heater element may be reduced to one-half that required for the shell.

§ 179.100-5 Bursting pressure. (a) The minimum required bursting pressure is listed in § 179.101.

§ 179.100-6 Thickness of plate. (a) The wall thickness after forming of the tank shell and heads must not be less than that specified in § 179.101, nor that calculated by the following formula:

$$t = \frac{Pd}{2SE}$$

where:

d = inside diameter in inches

E = 1.0 welded joint efficiency, except for heads with seams = 0.9;

P = Minimum required bursting pressure in p.s.i.;

S = Minimum tensile strength of plate material in p.s.i., as prescribed in § 179.100-7;

t = Minimum thickness of plate in inches after forming.

(b) If plates are clad with material having tensile strength properties at least equal to the base plate, the cladding may be considered a part of the base plate when determining thickness. If cladding material does not have tensile strength at least equal to the base plate, the base plate alone shall meet the thickness requirement.

(c) When aluminum plate is used, the minimum width of bottom sheet of tank shall be 60 inches, measured on the arc, but in all cases the width shall be sufficient to bring the entire width of the longitudinal welded joint, including welds, above the bolster.

§ 179.100-7 Materials. (a) Steel plate: Steel plate materials used to fabricate tank shell and manway nozzle must comply with one of the following specifications with the indicated minimum tensile strength and elongation in the welded condition. The maximum allowable carbon content must be 0.31 percent when the individual specification allows carbon greater than this amount. The plates may be clad with other approved materials.

Specifications	Minimum tensile strength (p.s.i.) welded condition[1]	Minimum elongation in 2 inches (percent) welded condition (longitudinal)
ASTM A 515-70, Gr. 55	55,000	28
ASTM A 515-70, Gr. 60	60,000	25
ASTM A 515-70, Gr. 65	65,000	20
ASTM A 515-70, Gr. 70	70,000	20
ASTM A 285-70a, Gr. A	45,000	29
ASTM A 285-70a, Gr. B	50,000	20
ASTM A 285-70a, Gr. C	55,000	20
ASTM A 516-70a, Gr. 55	55,000	28
ASTM A 516-70a, Gr. 60	60,000	25
ASTM A 516-70a, Gr. 65	65,000	20
ASTM A 516-70a, Gr. 70	70,000	20
AAR TC128-70, Gr. A and B	81,000	19
ASTM A 537-80, Class 1	70,000	23
ASTM A 302-70a, Gr. B	80,000	20

[1] Maximum stresses to be used in calculations.

(b) Aluminum alloy plate: Aluminum alloy plate material used to fabricate tank shell and manway nozzle must be suitable for fusion welding and must comply with one of the following specifications with its indicated minimum tensile strength and elongation in the welded condition.

Specifications	Minimum tensile strength (p.s.i.) 0 temper, welded condition[2][3]	Minimum elongation in 2 inches (percent) 0 temper, welded condition (longitudinal)
ASTM B 209-70, Alloy 5052[1] ...	25,000	18
ASTM B 209-70, Alloy 5083[2] ...	38,000	16
ASTM B 209-70, Alloy 5086[1] ...	35,000	14
ASTM B 209-70, Alloy 5154[1] ...	30,000	18
ASTM B 209-70, Alloy 5254[1] ...	30,000	18
ASTM B 209-70, Alloy 5454[1] ...	31,000	18
ASTM B 209-70, Alloy 5652[1] ...	25,000	18
ASTM B 209-70, Alloy 6061[4] ...	[5] 24,000	[5] 5

[1] For fabrication, the parent plate material may be 0, H112, or H32 temper, but design calculations must be based on minimum tensile strength shown.
[2] 0 temper only.
[3] Weld filler metal 5556 must not be used.
[4] Not authorized for tank shells, manways or domes.
[5] T6 temper only.
[6] Maximum stress to be used in calculations.

(c) All attachments welded to tank shell must be of approved material which is suitable for welding to the tank.

§ 179.100-8 Tank heads. (a) The tank head shape shall be an ellipsoid of revolution in which the major axis shall equal the diameter of the shell adjacent to the head and the minor axis shall be one-half the major axis.

(b) Each tank head made from steel which is required to be "fine grain" by the material specification, which is hot formed at a temperature exceeding 1700° F., must be normalized after forming by heating to a temperature between 1550° and 1700° F. by holding at that temperature for at least 1 hour per inch of thickness (30-minute minimum), and then by cooling in air. If the material specification requires quenching and tempering, the treatment specified in that specification must be used instead of the one specified above.

§ 179.100-9 Welding. (a) All joints shall be fusion-welded in compliance with the requirements of AAR Specifications for Tank Cars, Appendix W. Welding procedures, welders and fabricators shall be approved. Also see § 179.104.

§ 179.100-10 Postweld heat treatment. (a) After welding is complete, steel tanks and all attachments welded thereto must be postweld heat treated as a unit in compliance with the requirements of AAR Specifications for Tank Cars, Appendix W.

(b) For aluminum tanks, postweld heat treatment is prohibited.

§ 179.100-11 Tank mounting. (a) See §§ 179.10 and 179.104-3.

§ 179.100-12 Manway nozzle, cover and protective housing. (a) Manway nozzles must be of approved design of forged or rolled steel for steel tanks or of fabricated aluminum alloy for aluminum tanks, with access opening at least 18 inches inside diameter, or at least 14 inches by 18 inches around or oval. Nozzle must be welded to the tank and the opening reinforced in an approved manner in compliance with the requirements of AAR Specifications for Tank Cars, Appendix E, Figure E-10.

(b) Manway cover shall be machined to approved dimensions and be of forged or rolled carbon or alloy steel, rolled aluminum alloy or nickel when required by the lading. Minimum thickness is listed in § 179.101. Manway cover shall be attached to manway nozzle by through or stud bolts not entering tank, except as provided in § 179.103-2(a).

(c) Except as provided in § 179.103, protective housing of cast, forged or fabricated approved material must be bolted to manway cover with not less than twenty ¾-inch studs. The shearing value of the bolts attaching protective housing to manway cover must not exceed 70 percent of the shearing value of bolts attaching manway cover to manway nozzle. Housing must have steel sidewalls not less than three-fourths inch in thickness and must be equipped with a metal cover not less than one-fourth inch in thickness that can be securely closed. Housing cover must have suitable stop to prevent cover striking loading and unloading connections and be hinged on one side only with approved riveted pin or rod with nuts and cotters. Openings in wall of housing must be equipped with screw plugs or other closures.

§ 179.100-13 Venting, loading and unloading valves, measuring and sampling devices. (a) Venting, loading and unloading valves shall be of approved design, made of metal not subject to rapid deterioration by the lading, and must withstand the tank test pressure without leakage. The valves shall be bolted to seatings on the manway cover, except as provided in § 179.103. Valve outlets shall be closed with approved screw plugs or other closures fastened to prevent misplacement.

(b) The interior pipes of the loading and unloading valves shall be anchored and, except as prescribed in § 179.102, or § 179.103, may be equipped with excess flow valves of approved design.

(c) Gaging device, sampling valve and thermometer well are not specification requirements. When used, they shall be of approved design, made of metal not subject to rapid deterioration by the lading, and shall withstand the tank test pressure without leakage. Interior pipes of the gaging device and sampling valve, except as prescribed in § 179.102, or § 179.103, may be equipped with excess flow valves of approved design. Interior pipe of the thermometer well shall be anchored in an approved manner to prevent breakage due to vibration. The thermometer well shall be closed by an approved valve attached close to the manway cover, or other approved location, and closed by a screw plug. Other approved arrangements that permit testing thermometer well for leaks without complete removal of the closure may be used.

(d) An excess flow valve as referred to in this specification, is a device which closes automatically against the outward flow of the contents of the tank such as may be encountered in case the external closure valve is broken off or removed during transit. Excess flow valves may be designed with a by-pass to allow the equalization of pressures.

(e) Bottom of tank shell may be equipped with a sump or siphon bowl, or both, welded or pressed into the shell. Such sumps or siphon bowls, if applied, are not limited in size and must be made of cast, forged or fabricated metal. Each sump or siphon bowl must be of good welding quality in conjunction with the metal of the tank shell. When the sump or siphon bowl is pressed in the bottom of the tank shell, the wall thickness of the pressed section must not be less than that specified for the shell. The section of a circular cross section tank to which a sump or siphon bowl is attached need not comply with the out-of-roundness requirement specified in AAR Specifications for Tank Cars, Appendix W, W14.06. Any portion of a sump or siphon bowl not forming a part of cylinder of revolution must have walls of such thickness and be so reinforced that the stresses in the walls caused by a given internal pressure are no greater than the circumferential stress which would exist under the same internal pressure in the wall of a tank of circular cross section designed in accordance with § 179.100-6(a). In no case less than that specified in § 179.101-1(a).

§ 179.100-14 Bottom outlets. (a) Bottom outlets for discharge of lading is prohibited, except as provided in § 179.103-3. If indicated in § 179.101, tank may be equipped with a bottom washout of approved construction. If applied, bottom washout shall be in accordance with the following requirements:

(1) The extreme projection of the bottom washout equipment may not be more than that allowed by Appendix E of the AAR Specifications for Tank Cars.

(2) Bottom washout shall be of cast, forged or fabricated metal and shall be fusion-welded to the tank. It shall be of good weldable quality in conjunction with metal of tank.

(3) If the bottom washout nozzle extends 6 inches or more from shell of tank, a V-shaped breakage groove shall be cut (not cast) in the upper part of the outlet nozzle at a point immediately below the lowest part of the inside closure seat or plug. In no case may the nozzle wall thickness at the root of the "V" be more than ¼-inch. Where the nozzle is not a single piece, provision shall be made for the equivalent of the breakage groove. The nozzle must be of a thickness to insure that accidental breakage will occur at or below the "V" groove or its equivalent. On cars without continuous center sills, the breakage groove or its equivalent may not be more than 15 inches below the tank shell. On cars with continuous center sills, the breakage groove or its equivalent must be above the bottom of the center sill construction.

(4) The closure plug and seal shall be readily accessible or removable for repairs.

(5) The closure of the washout nozzle must be equipped with a ¾-inch solid screw plug. Plug must be attached by at least a ¼-inch chain.

(6) Joints between closures and their seats may be gasketed with suitable material.

§ 179.100-15 Safety relief valves. (a) The tank must be equipped with one or more safety relief valves of approved design, made of metal not subject to rapid deterioration by the lading. The safety relief valve, or valves, must be mounted on manway cover, except as provided in § 179.103. The total valve discharge capacity must be sufficient to prevent building up pressure in tank in excess of 82½ percent of the tank test pressure or 10 p.s.i. above the start-to-discharge pressure, whichever is higher. The start-to-discharge and vapor-tight pressures must comply with § 179.101 and must not be affected by any auxiliary closure or other combination. For certain commodities, alternate pressures are permitted (see § 179.102-11). See AAR Specifications for Tank Cars, Appendix A, for formula for calculating discharge capacity.

(b) When a safety relief valve is used in combination with a breaking pin device, the breaking pin device must be designed to fail at a pressure

[1] The use of existing tanks authorized but new construction not authorized.

of 75 percent of the tank test pressure and safety relief valve must be set for a start-to-discharge pressure of 71 percent of the tank test pressure. However, for spec. DOT-105A500-W tanks, the start-to-discharge pressure must be 360 p.s.i. For certain commodities, alternate pressures are permitted (see § 179.102-11).

(c) When a safety relief valve is used in combination with a frangible disc, the frangible disc must be designed to burst at a pressure of 75 percent of the tank test pressure and the safety relief valve must be set for a start-to-discharge pressure of 71 percent of the tank test pressure, as prescribed in § 179.101. Provisions must be made to prevent any accumulation of pressure between the frangible disc and safety relief valve. For certain commodities, alternate pressures are permitted (see § 179.102-11).

§ 179.100-16 Attachments. (a) Reinforcing pads must be used between external brackets and shells if the attachment welds exceed 6 linear inches of ¼-inch fillet or equivalent weld per bracket or bracket leg. When reinforcing pads are used, they must not be less than one-fourth inch in thickness, have each corner rounded to a 1 inch minimum radius, and be attached to the tank by continuous fillet welds except for venting provisions. The ultimate shear strength of the bracket-to-reinforcing pad weld must not exceed 85 percent of the ultimate shear strength of the reinforcing pad-to-tank weld.

§ 179.100-17 Closures for openings. (a) Closures shall be of approved design and made of metal not subject to rapid deterioration by the lading. Plugs, if used, shall be solid, with NPT threads, and shall be of a length which will screw at least six threads inside the face of fitting or tank.

§ 179.100-18 Tests of tanks. (a) Each tank shall be tested by completely filling tank and manway nozzle with water or other liquid having similar viscosity, at a temperature which shall not exceed 100° F. during the test, and applying the pressure prescribed in § 179.101. The tank shall hold the prescribed pressure for at least 10 minutes without leakage or evidence of distress.

(b) Insulated tanks shall be tested before insulation is applied.

(c) Caulking of welded joints to stop leaks developed during the foregoing test is prohibited. Repairs in welded joints shall be made as prescribed in AAR Specifications for Tank Cars, Appendix W.

(d) Testing of exterior heaters is not a specification requirement.

§ 179.100-19 Tests of safety relief valves. (a) Each valve shall be tested by air or gas for compliance with § 179.101 before being put into service.

§ 179.100-20 Stamping. (a) To certify that the tank complies with all specification requirements, each tank shall be plainly and permanently stamped in letters and figures at least ⅜ inch high into the metal near the center of both outside heads as follows:

	Example of required stamping
SPECIFICATION	DOT-105A100-W
MATERIAL	ASTM A515-70
CLADDING MATERIAL (if any)	ASTM A240-304 Clad
TANK BUILDERS INITIALS	ABC
DATE OF ORIGINAL TEST	00-0000
CAR ASSEMBLER (if other than tank builder)	DEF
WATER CAPACITY	00000 LBS.

§ 179.100-21 Stenciling. (a) The tank or the jacket if tank is insulated, shall be stenciled in compliance with the requirements of AAR Specifications for Tank Cars, Appendix C.

(b) Water capacity stencil is required.

§ 179.100-22 Certificate of construction. (a) See § 179.5.

§ 179.100-23 Alternative requirements for tank head puncture resistance systems. (a) Tank cars required to have puncture resistance systems in accordance with § 179.105-5 may, as an alternative, be equipped with a head shield at each end of the car in accordance with the requirements of this section. The shield must be:

(1) At least ½-inch thick, and made from steel produced in accordance with specifications ASTM A242, A572-GR50, A515-70, A516-GR70, or AAR TC-128B.

(2) In the shape and size of the lower half of the head of the tank car or in the shape of a trapezoid with the following dimensions:

(i) A minimum width at the top of the center sill of four feet six inches, measured in a straight line between extreme edges;

(ii) A minimum width at the top of shield of nine feet measured in a straight line between the extreme edges; (For cars with diameters less than nine feet, the width of the head shield must not extend beyond outermost portion of the head and be not less than three inches from the outermost point of the head.)

(iii) The top corners of the shield rounded to a minimum radius of 9 inches;

(iv) The bottom corners of the shield rounded to a minimum radius of 3 inches;

(v) All inside edges of the shield chamfered to a minimum of ⅛-inch;

(vi) A minimum height of four feet six inches, and

(vii) Located so that the bottom of the shield touches the top of the center sill.

(3) Shaped to the contour of the tank shell head, utilizing a minimum of three vertical bend lines; and

(4) The head protection device must meet the impact test requirements of paragraph AAR. 24-5 in the "Specifications for Tank Cars" Standard, effective October 1, 1972. The impact test acceptance criterion is that the device and its supporting structure does not sustain visible permanent damage or deformation such as fractures, cracks, bends and dents. The object of this requirement is to assure that the head shield has adequate strength to remain attached and functionally unimpaired during normal operations.

The head protection device must meet all of the workmanship requirements of the "AAR Specifications for Design, Fabrication and Construction of Freight Cars, dated September 1, 1964."

§ 179.101 Individual specification requirements applicable to pressure tank car tanks.

§ 179.101-1 Individual specification requirements. (a) In addition to § 179.100 the individual specification requirements are as follows:

[1] When steel of 65,000 to 81,000 p.s.i. minimum tensile strength is used, the thickness of plates shall be not less than 7/16 inch, and when steel of 81,000 p.s.i. minimum tensile strength is used, the minimum thickness of plate shall be not less than 11/16 inch.

[2] When approved material other than aluminum alloys are used, the thickness shall be not less than 2 1/4 inches.

[3] When steel of 65,000 p.s.i. minimum tensile strength is used, minimum thickness of plates shall be not less than 1/2 inch.

[4] At least the upper two-thirds of the exterior of the tank manway nozzle and all appurtenances in contact with the area of the tank shall have a finish coat of white paint; except that tanks used for hydrogen fluoride may have a dark colored band not exceeding 14 feet wide around the center of the tank in the top platform and fitting area.

[5] For inside diameter of 87 inches or less, the thickness of plates shall be not less than 1/2 inch.

[6] See 179.102-11 for optional setting for certain commodities.

[7] See AAR specifications for tank cars, appendix E, E4.01 and 179.103-2.

[8] Purposely left blank.

[9] When the use of nickel is required by the lading, the thickness shall not be less than 2 inches.

[10] Each tank head may be equipped with not more than one opening for use in purging tank interior.

[11] Tanks converted to DOT-112A400F from existing forge-welded specification DOT-105A500 tanks by modification using conversion details complying with DOT-112A400W specification requirements, shall be stenciled by substituting the letter "F" for the letter "W" in the specification designation.

[12] When tank car head shields meeting the requirements of § 179.100 have been applied, an "S" must be substituted for the "A" in the specification marking.

For explanation of abbreviations and reference marks, see last page of this tariff.

§ 179.102 Special commodity requirements for pressure tank car tanks. (a) In addition to §§179.100 and 179.101 the following requirements are applicable:

§ 179.102-1 Carbon dioxide, refrigerated liquid. (a) Tank cars used to transport carbon dioxide, refrigerated liquid must comply with the following special requirements:

(1) All plates for tank, manway nozzle and anchorage of tanks must be made of carbon steel complying with ASTM Specification A516-79b, Grades 55, 60, 65, or 70, or AAR Specification TC128-78, Grade B. The ASTM A516 plate must also meet the Charpy V-Notch test requirements of ASTM A20-79b (see Table 16) in the longitudinal direction of rolling. The TC128 plate must also meet the Charpy V-Notch energy absorption requirements of 15 ft-lb minimum average for 3 specimens and 10 ft-lb minimum for one specimen at minus 50° F in the longitudinal direction of rolling in accord with ASTM Specification A370-77. Production-welded test plates prepared as required by W4.00 of AAR Specifications for Tank Cars, Appendix W, must include impact test specimens of weld metal and heat-affected zone. As an alternate, anchor legs may be fabricated of stainless steel, ASTM Specification A240-79 Types 304, 304L, 316 or 316L for which impact tests are not required.

(2) Tank shall be insulated with an approved material of sufficient thickness so that the thermal conductance at 60° F is not more than 0.03 Btu per hour per square foot per degree F. temperature differential; except that in order to permit an anchorage which shall not exceed seven inches from top of center sills to bottom of tank, the insulation thickness directly over the sills may be reduced to give thermal conductance not exceeding 0.04 Btu per hour per square foot per degree F. temperature differential.

(3) Tank shall be equipped with one safety relief valve set for the start-to-discharge pressure listed in §179.101, and one safety vent of approved design, set to function at a pressure less than the tank test pressure, and not less than 75 percent of tank test pressure. The discharge capacity of each of these safety relief devices shall be sufficient to prevent building up pressure in tank in excess of 82½ percent of the tank test pressure.

(4) Tank shall be equipped with two pressure-regulating valves of approved design, set to open at a pressure not exceeding 350 psi. on spec. 105A500-W tanks or 400 psi. on spec. 105A600-W tanks.

(5) Each regulating valve and safety relief device shall have its final discharge piped to the outside of the protective housing.

(6) Tank anchor-to-tank shell fillets welds must be examined by a suitable nondestructive testing method to ensure that welds are free from cracks or other detrimental defects.

§ 179.102-2 Chlorine. (a) Each tank car used to transport chlorine must comply with all of the following:

(1) Each tank must be constructed in compliance with spec. DOT-105A500W. A tank car must be operated and the jacket stenciled either DOT-105A300W or DOT105A500W, and each tank must be equipped with the safety relief valve required by the stenciled specification.

(2) Interior pipes of liquid discharge valves must be equipped with excess flow valves of approved design.

(3) Insulation must be 4 inches minimum thickness of corkboard or of polyurethane foam or must be 2 inches minimum thickness of 4 pounds per cubic foot minimum density ceramic fiber covered by 2 inches minimum thickness of glass fiber.

(4) Tanks must be fabricated from carbon steel complying with ASTM Specification A-516-70a Grade 70, or AAR Specification TC-128-70, Grade A or B.

§ 179.102-3 Liquefied flammable gases. (a) Any authorized tank car used to transport liquefied flammable gases must comply with the following special requirements.

(1) The interior pipes of the loading and unloading valves and sampling valves, also the gaging device when it provides a means for passage of the lading from the interior to the exterior of the tank, must be equipped with excess flow valves of an approved design. If the opening for passage of lading through the gaging device is not more than 0.060-inch diameter, an excess flow valve is not required.

(2) The protective housing cover must be provided with an opening above each safety relief valve which must be concentric with the discharge of the valve and have an area at least equal to the valve outlet area. Each opening must be provided with a weatherproof cover designed for vertical discharge.

(3) Gaskets for manway cover plates and for mounting of fittings must be asbestos type or approved high-temperature resistant equivalent.

§ 179.102-4 Vinyl fluoride, inhibited.

Each tank used to transport vinyl fluoride, inhibited, must comply with the following special requirements:

(a) The tank must conform with specification DOT-105A600W and must be designed for loading at minus 50° F. or colder. After December 31, 1986, each tank built before September 1, 1981, having a water capacity (shell full volume, including manways) exceeding 18,500 U.S. gallons and used for the transportation of vinyl fluoride, inhibited must conform to class DOT-105J.

(b) All plates for the tank must be fabricated of material listed in paragraph (b)(2) of this section, and appurtenances must be fabricated of material listed in paragraph (b)(1) or (b)(2) of this section.

(1) Stainless steel, ASTM Specification A240, Type 304, 304L, 316 or 316L, in which case impact tests are not required, or

(2) Steel complying with ASTM Specification A516, Grade 70; ASTM Specification A537, Class 1; or AAR Specification TC128, Grade B, in which case impact tests must be performed as follows:

(i) ASTM Specification A516 and A537 material must meet the Charpy V-notch test requirements, in longitudinal direction of rolling, of ASTM Specification A20.

(ii) AAR Specification TC128 material must meet the Charpy V-notch test requirements, in longitudinal direction of rolling, of 15 ft. lb. minimum average for 3 specimens, with a 10 ft. lb. minimum for any one specimen, at minus 50° F. or colder, in accordance with ASTM Specification A370.

(iii) Production welded test plates must—

(A) Be prepared in accordance with AAR Specifications for Tank Cars, Appendix W, W4.00;

(B) Include impact specimens of weld metal and heat affected zone prepared and tested in accordance with AAR Specifications for Tank Cars, Appendix W, W9.00; and

(C) Meet the same impact requirements as the plate material.

(c) Insulation must be of approved material.

(d) The tank must be equipped with at least one safety relief valve, set for the start-to-discharge pressure listed in §179.101-1. The discharge capacity of each safety relief device must be sufficient to prevent the build up of pressure in the tank in excess of 82½ percent of the tank test pressure. The discharge from each safety relief device must be directed outside the protective housing.

(e) Excess flow valves must be installed under all liquid and vapor valves, except safety relief valves.

(f) A thermometer well may be installed.

(g) Only an approved gaging device may be installed.

(h) A pressure gage may be installed.

(i) Aluminum, copper, silver, zinc, or an alloy containing any of these metals may not be used in the tank construction, or in fittings in contact with the lading.

(j) The jacket must be stenciled, adjacent to the water capacity stencil, "MINIMUM OPERATING TEMPERATURE——° F."

(k) The tank car and insulation must be designed to prevent the vapor pressure of the lading from increasing from the pressure at the maximum allowable filling density to the start-to-discharge pressure of the safety relief valve within 30 days, at an ambient temperature of 90° F.

(l) Tank anchor-to-tank shell fillets welds must be examined by a suitable nondestructive testing method to ensure that welds are free from cracks or other detrimental defects.

§ 179.102-5 Nitrosyl chloride. (a) Tank cars used to transport nitrosyl chloride must comply with the following special requirements:

(1) Tanks shall be made of or clad with a metal not subject to rapid deterioration by the lading; all appurtenances such as manway covers, venting, loading and unloading valves, safety relief valves, excess flow valves, and eduction pipes, shall be made of metal not subject to rapid deterioration by the lading; cork shall be used as an insulating material.

§ 179.102-6 Vinyl chloride or vinyl methyl ether, inhibited.

(a) Tank cars used to transport vinyl chloride, or vinyl methyl ether, inhibited, must comply with the following special requirements:

(1) All parts of valves and safety relief devices in contact with the lading must be of a metal or other material suitably treated, if necessary, which will not cause formation of any acetylides.

(2) The interior pipes of the loading and unloading valves and sampling valve, also the gaging device when it provides a means for passage of the lading from the interior to the exterior of the tank, must be equipped with excess flow valves of an approved design. If the opening for passage of lading through the gaging device is not more than 0.060 inch diameter, an excess flow valve is not required.

(3) [Reserved]

(4) For alternate safety relief valve settings, see §179.102-11.

(5) For gasket requirements, see §179.102-11(b).

§ 179.102-7 Bromine. (a) Tank cars used to transport bromine must comply with the following special requirements:

(1) The tank shall be nickel clad at least 20 percent or shall be lined with lead at least 1/16 inch thick; openings in tank heads to facilitate application of lead lining are authorized if closed in an approved manner; all closures and appurtenances in contact with the lading shall be lead lined or shall be made of metal not subject to rapid deterioration by the lading; all interior welds in nickel clad tanks shall be protected by pure nickel butt straps to eliminate iron contamination. Except as otherwise provided herein, the water weight capacity of the tank shall not exceed 20,400 pounds. When tanks are equipped with manway cover plates, safety relief valves, venting, loading and unloading valves in accordance with spec. 105A300-W, and tank jackets are stenciled spec. 105A300-W, but in all other respects are constructed and maintained in full compliance with spec. 105A500-W, the water weight capacity of the tank shall not exceed 37,400 pounds.

§ 179.102-8 Motor fuel antiknock compound. (a) Tank cars used to transport motor fuel antiknock compounds must comply with the following special requirements:

(1) Openings in tank heads to facilitate application of nickel lining are authorized if closed in an approved manner.

§ 179.102-9 Nitrogen tetroxide or Nitrogen tetroxide-nitric oxide mixtures. (a) Tank cars used to transport nitrogen tetroxide or nitrogen tetroxide nitric oxide mixtures must comply with the following special requirements.

(1) Tanks must be insulated with not less than four inches of cork-board. All valves and fittings must be protected by the securely attached cover made of metal not subject to rapid deterioration by the lading, and all valve openings, except the safety relief valves, must be fitted with screw plugs or caps to prevent leakage in the event of valve failure. Safety relief valve must be equipped with an approved stainless steel or platinum frangible disc. Written procedures covering details of tank car appurtenances, manway fittings and safety relief devices, and marking, loading, handling, inspection and testing practices, must be filed with and approved by the Bureau of Explosives before any tank car is offered for transportation of these commodities.

§ 179.102-10 Hydrocyanic acid. (a) Tank cars used to transport hydrocyanic acid must comply with the following special requirements:

(1) Each tank car must be registered and the jacket stenciled "DOT 105-A300-W" and be equipped with the safety relief valves required by that specification. Tanks must be insulated with not less than 4 inches of cork-board. Written procedures covering details of tank car appurtenances, manway fittings and safety relief devices, and marking, loading, handling, inspection and testing practices, must be filed with and approved by the Bureau of Explosives before any tank car is offered for transportation of hydrocyanic acid.

§ 179.102-11 Liquefied petroleum gas, butadiene, anhydrous ammonia, methylacetylene-propadiene, stabilized, chlorodifluoromethane, or vinyl chloride. (a) Tank cars used to transport liquefied petroleum gas, butadiene, anhydrous ammonia, methylacetylene-propadiene, stabilized, chlorodifluoromethane, or vinyl chloride may, as an alternate, conform with the following special requirements:

(1) Safety relief valves may be set to the following pressures, provided the total valve discharge capacity is sufficient to prevent building up pressure in the tank in excess of 90 percent of the tank test pressure.

Safety relief valves, p.s.i.	DOT Specifications		
	105A300W	112A340W, 114A340W	112A400W, 114A400W
Start-to-discharge pressure	247.5	280.5	330
Start-to-discharge tolerance	±7.5	±8.4	±10
Vapor tight pressure (minimum)	196	224	264
Flow rating pressure	270	306	360

(b) Gaskets for manway covers and for mounting of fittings must be asbestos type or approved high-temperature resistant equivalent.

§ 179.102-12 Ethylene oxide. (a) Each tank car used to transport ethylene oxide must be constructed to be in compliance with the following special requirements:

(1) The tank must be constructed in accordance with DOT-105A * * * W specification, and its jacket stenciled "DOT-105A-100W."

(2) Each safety relief valve must be in compliance with the requirements specified in the DOT-105A100W tank car specification. Each safety relief valve must have its discharge piped to the top of the manway bonnet assembly. Vapor exit from the assembly must be provided through a full opening weather cap located directly above the safety valve vent pipe.

(3) Copper, silver, mercury, magnesium, or their alloys may not be used in any part of the tank or appurtenances if that part or appurtenance is normally in contact with ethylene oxide liquid or vapor.

(4) Interior pipes of liquid discharge valves, vapor lines, gaging devices (when the device provides a means for passage of the lading from the interior to the exterior of the tank) and sampling lines must be equipped with excess flow valves of an approved design.

(5) Each tank must be equipped with a thermometer well.

(6) Each tank must be insulated with glass fiber except tank cars built before January 31, 1975, are authorized in this service when insulated with cork.

(7) The manway protective housing and cover must be insulated with glass fiber or other material that will provide protection against heat deterioration of the valves and any resilient material contained within the housing. Compliance with this provision is required after January 31, 1975, except that tank cars which are not in compliance and were built before January 31, 1975, must be in compliance by July 31, 1976.

(8) Neoprene, natural rubber, and asbestos gaskets are prohibited. All O-rings, packings and gaskets must be constructed of materials which do not react spontaneously with or lower the autoignition temperature of ethylene oxide.

(9) Each tank built after August 31, 1981, shall be constructed in accordance with class 105J, except that the safety relief valve requirements of § 179.106-2(c)(4) shall not apply. Each tank built after February 29, 1984, shall be constructed in accordance with class 105J.

(10) After December 31, 1986, each tank built before September 1, 1981, having a water capacity (shell full volume, including manways) exceeding 18,500 U.S. gallons and used for the transportation of ethylene oxide shall conform to class DOT-105J.

§ 179.102-13 Hydrofluoric acid, anhydrous. (a) Tank cars used to transport hydrofluoric acid, anhydrous, must comply with the following special requirements:

(1) Tanks must be equipped with valves and appurtenances approved for this particular service, made of metal not subject to rapid deterioration by the lading. For safety relief valves, see § 179.100-15(b) and (c).

(2) For spec. DOT-114A400W tanks, valves and fittings must be located on the top of the tank.

(3) Bottom opening in tank prohibited.

§ 179.102-14 Acrolein inhibited. Each tank car used to transport acrolein inhibited must be a specification DOT-105A300W or higher rated tank, registered and the jacket stenciled "DOT-105A200W" and be equipped with the safety relief valve required by that specification.

Effective January 1, 1980

§ 179.102-15 Sodium, metallic. Tank cars used to transport metallic sodium must have exterior heater coils fusion welded to tank shell.

§ 179.102-16 Sulfur trioxide stabilized. Tank cars used to transport sulfur trioxide stabilized must be equipped with safety relief valves of approved design. Tanks equipped with interior heating coils not permitted.

§ 179.102-17 Hydrogen chloride, refrigerated liquid. Each tank car used to transport hydrogen chloride, refrigerated liquid must comply with the following special requirements:

(a) The tank car must comply with Specification DOT-105A500W and be designed for loading at minus 50° F. or colder.

(b) All plates for the tank must be fabricated of material listed in paragraph (b)(2) of this section, and appurtenances must be fabricated of material listed in paragraph (b)(1) or (b)(2) of this section.

(1) Stainless steel, ASTM Specification A240, Type 304, 304L, 316, or 316L, in which case impact tests are not required; or

(2) Steel complying with ASTM Specification A516, Grade 70; ASTM Specification A537, Class 1; or AAR Specification TC128, Grade B, in which case impact tests must be performed as follows:

(i) ASTM Specification A516 and A537 material must meet the Charpy V-notch test requirements, in longitudinal direction of rolling, of ASTM Specification A20.

(ii) AAR Specification TC128 material must meet the Charpy V-notch test requirements, in longitudinal direction of rolling of 15 ft.-lb. minimum average for 3 specimens, with a 10 ft.-lb. minimum for any one specimen, at minus 50° F. or colder, in accordance with ASTM Specification A370.

(iii) Production welded test plates must—

(A) Be prepared in accordance with AAR Specifications for Tank Cars, Appendix W, W4.00;

(B) include impact test specimens of weld metal and heat affected zone prepared and tested in accordance with AAR Specifications for Tank Cars, Appendix W, W9.00; and

(C) meet the same impact requirements as the plate material.

(c) Insulation must be of approved material.

(d) Safety relief valves must be trimmed with monel or other approved material and equipped with a frangible disc of silver, polytetrafluoroethylene coated monel, or tantalum. Each safety relief device shall have the space between the frangible disc and the relief valve vented with a suitable auxiliary valve. The discharge from each safety relief valve must be directed outside the protective housing.

(e) Loading and unloading valves must be trimmed with Hastelloy B or C, monel, or other approved material, and identified as "Vapor" or "Liquid". Excess flow valves must be installed under all liquid and vapor valves, except safety relief valves.

(f) A thermometer well may be installed.

(g) Only an approved gaging device may be installed.

(h) A sump must be installed in the bottom of the tank under the liquid pipes.

(i) All gaskets must be made of, or coated with, polytetrafluoroethylene or other approved material.

(j) The tank car tank may be equipped with exterior cooling coils on top of the tank car shell.

(k) The jacket must be stenciled, adjacent to the water capacity stencil, "MINIMUM OPERATING TEMPERATURE——° F."

(l) The tank car and insulation must be designed to prevent the pressure of the lading from increasing from the pressure at the maximum allowable filling density to the start-to-discharge pressure of the safety relief valve within 30 days, at an ambient temperature of 90° F.

(m) Tank anchor-to-tank shell fillets welds must be examined by a suitable nondestructive testing method to ensure that welds are free from cracks or other detrimental defects.

§ 179.102-20 Dimethyl hydrazine unsymmetrical. Class

DOT-105AW tank cars used to transport dimethyl hydrazine unsymmetrical must be stenciled DOT-105A100W. Tanks must be equipped with steel or stainless steel safety relief valves of the type and size used on specification DOT-105A100W tank cars.

§ 179.103 Special requirements for class 114A * * * tank car tanks. (a) In addition to the applicable requirements of §§179.100 and 179.101 the following requirements shall be complied with:

§ 179.103-1 Type. (a) Tanks built under this section may be of any approved cross section.

(b) Any portion of the tank shell not circular in cross section shall have walls of such thickness and be so reinforced that the stresses in the walls caused by a given internal pressure are no greater than the circumferential stresses which would exist under the same internal pressure in the wall of a tank of circular cross section designed in accordance with paragraphs §179.100-6(a) and (b), but in no case shall the wall thickness be less than that specified in §179.101.

(c) Manway and cover may be located other than at the top of the tank.

(d) Valves and fittings need not be mounted on the manway cover.

(e) One opening may be provided in each head for use in purging the tank interior.

§ 179.103-2 Manway cover. (a) Manway cover may be of the internal self-energizing type and shall be of approved design.

(b) If no valves or measuring and sampling devices are mounted on manway cover, no protective housing is required.

§ 179.103-3 Venting, loading and unloading valves, measuring and sampling devices. (a) Venting, loading and unloading valves, measuring and sampling devices, when used, shall be attached to a nozzle or nozzles on the tank shell or heads.

(b) These valves and appurtenances must be grouped in one location and, except as provided in §179.103-5, must be equipped with a protective housing with cover, or may be recessed into tank shell with cover. An additional set grouped in another location may be provided. Protective housing with cover, when used, must have steel sidewalls not less than three-fourths inch in thickness and a metal cover not less than one-fourth inch in thickness that can be securely closed. Underframe sills are an acceptable alternate to the protective housing cover, provided the arrangement is of approved design. For fittings recessed into tank shell, protective cover must be metal and not less than one-fourth inch in thickness.

(c) When tank car is used to transport liquefied flammable gases, the interior pipes of the loading, unloading, and sampling valves must be equipped with excess flow valves of approved design except when quick closing internal valves of approved design are used. When the interior pipe of the gaging device provides a means of the passage of lading from the interior to the exterior of the tank, it must be equipped with an excess flow valve of approved design or with an orifice not exceeding 0.060 inch.

§ 179.103-4 Safety relief devices and pressure regulators.

(a) Safety relief devices and pressure regulators must be located on top of the tank near the center of the car on a nozzle, mounting plate or recess in the shell. Through or stud bolts, if used, must not enter the tank.

(b) Metal guard of approved design must be provided to protect safety relief devices and pressure regulators from damage.

§ 179.103-5 Bottom outlets. (a) In addition to or in place of the venting, loading and unloading valves, measuring and sampling devices as prescribed in §179.103-3, tanks may be equipped with approved bottom outlet valves. If applied, bottom outlet valves must meet the following requirements:

(1) When external bottom outlet valve without interior pipes is used in liquefied flammable gas service, the valve opening must be closed with an internal bolted or self-energizing closure of approved design. Protective housing is not required. On cars with center sills, a ball valve may be welded to the outside bottom of the tank or mounted on a pad or nozzle with a tongue and groove or male and female flange attachment, but in no case shall the breakage groove or equivalent extend below the bottom flange of the center sill. On cars without continuous center sills, a ball valve may be welded to the outside bottom of the tank or mounted with a tongue and groove or male and female flange attachment on a pad attached to the outside bottom of the tank. The mounting pad must have a maximum thickness of 2½ inches measured on the longitudinal centerline of the tank. The valve operating mechanism must be provided with a suitable locking arrangement to insure positive closure during transit.

(2) When internal bottom outlet valve is used in liquefied flammable gas service, the outlet of the valve must be equipped with an excess flow valve of approved design, except when a quick-closing internal valve of approved design is used. Protective housing is not required.

(3) Bottom outlet valve must be equipped with a liquid tight closure at its lower end.

(b) Bottom outlet equipment must be of approved design and must meet the following requirements:

(1) The extreme projection of the bottom outlet equipment may not be more than allowed by Appendix E of the AAR Specifications for Tank Cars. All bottom outlet reducers and closures and their attachments shall be secured to car by at least ⅜-inch chain, or its equivalent, except that bottom outlet closure plugs may be attached by ¼-inch chain. When the bottom outlet closure is of the combination cap and valve type, the pipe connection to the valve shall be closed by a plug, cap, or approved quick coupling device. The bottom outlet equipment should include only the valve, reducers and closures that are necessary for the attachment of unloading fixtures. The permanent attachment of supplementary exterior fittings must be approved by the AAR Committee on Tank Cars.

(2) Bottom outlet must be provided with a liquid tight closure at its lowest end.

(3) The valve operating mechanism must be provided with a suitable locking arrangement to insure positive closure during transit.

(4) If the outlet nozzle extends 6 inches or more from shell of tank, a V-shaped breakage groove shall be cut (not cast) in the upper part of the outlet nozzle at a point immediately below the lowest part of valve closet to the tank. In no case may the nozzle wall thickness at the roof of the "V" be more than ¼-inch. On cars without continuous center sills, the breakage groove or its equivalent may not be more than 15 inches below the tank shell. On cars with continuous center sills, the breakage groove or its equivalent must be above the bottom of the center sill construction.

(5) The valve body must be of a thickness which will insure that accidental breakage of the outlet nozzle will occur at or below the "V" groove, or its equivalent, and will not cause distortion of the valve seat or valve.

§ 179.104 Special requirements for spec. 105A200-F tank car tanks.

§ 179.104-1 Tanks built under these specifications must meet the requirements of §§179.100, 179.101, and when applicable, §179.102 and §179.104.

§ 179.104-2 Type. (a) Tanks built under this specification shall be fabricated by conversion from existing forge-welded steel tanks complying with specs. 105A300, 105A400, 105A500 or 105A600.

§ 179.104-3 Tank mounting. (a) The use of rivets as a means of attaching anchor to tank is permitted.

§ 179.104-4 Welding. (a) All joints shall be lap welded by the water gas process, hammered or rolled or other lap welded, hammered or rolled process which investigation and laboratory tests by the Mechanical Division of the AAR have proved will produce satisfactory results.

§ 179.105 Special requirements for Specifications 112 and 114 tank cars.

§ 179.105-1 General. (a) In addition to the requirements of this section, each tank car built under specification 112 and 114 must meet the applicable requirements of §§179.100, 179.101, 179.102, and 179.103.

(b) Notwithstanding the provisions of §§179.3, 179.4, and 179.6, AAR approval is not required for changes in or additions to specifications 112 and 114 tank cars necessary to comply with this section.

(c) Notwithstanding the provisions of §173.12a of this subchapter, no 112 and 114 tank car manufactured to specifications promulgated by the Canadian Transport Commission may be used

(1) After March 31, 1979, to transport hazardous materials in the United States unless it is equipped with a coupler vertical restraint system under § 179.105-6, except that an "empty" tank car (paragraph 172.510(c) of this subchapter) may be returned to Canada without a coupler vertical restraint system until July 1, 1979; nor

(2) After December 31, 1980, to transport flammable gases in the United States unless it is equipped with thermal protection under § 179.105-4 and tank head puncture resistance under § 179.105-5; and, to transport anhydrous ammonia in the United States unless it is equipped with tank head puncture resistance under § 179.105-5.

(d) As used in this section 179.105, "tank car owner" means a person whose reporting mark appears on any specification 112 or 114 tank car.

§ 179.105-2 New cars. (a) Each specification 112A and 114A tank car built after December 31, 1977, shall be equipped with a coupler restraint system that meets the requirements of §179.105-6.

(b) Each specification 112S and 114S tank car built after December 31, 1977, shall be equipped with:

(1) A coupler restraint system that meets the requirements of §179.105-6; and

(2) A tank head puncture resistance system that meets the requirements of §179.105-5.

(c) Each specification 112T and 112J, 114T, and 114J tank car built after December 31, 1977, shall be equipped with:

(1) A coupler restraint system that meets the requirements of §179.105-6;

(2) A tank head puncture resistance system that meets the requirements of §179.105-5;
(3) A thermal protection system that meets the requirements of §179.105-4; and
(4) A safety relief valve that meets the requirements of §179.105-7.
(d) Each specification 112 and 114 tank car shall be stenciled as prescribed in §179.105-8.

§ 179.105-3 Previously built cars. (a) After December 31, 1978, each specification 112 and 114 tank car built before January 1, 1978, shall be equipped with a coupler restraint system that meets the requirements of §179.105-6.
(b) Each tank car built before January 1, 1978, required to meet specification 112S and 114S, shall be equipped with a tank head puncture resistance system in accordance with the requirements of paragraph (d) of this section and §179.105-5, and be stenciled as prescribed in §179.105-8.
(c) Each tank car built before January 1, 1978, required to meet specification 112J, 112T, 114J, and 114T, shall:
(1) Be equipped with a thermal protective system that meets the requirements of §179.105-4;
(2) Be equipped with a tank head puncture resistance system that meets the requirements of §179.105-5;
(3) Be equipped with a safety relief valve that meets the requirements of §179.105-7; and
(4) Comply with paragraph (d) of this section.
(5) Be stenciled as prescribed in §179.105-8.
(d) Each tank car owner shall equip its tank cars which are subject to paragraphs (b) and (c) of this section in accordance with the following schedule:
(1) Each tank car which is being retrofitted in accordance with paragraph (b) shall be retrofitted not later than December 31, 1979.
(2) Each tank car which is being retrofitted in accordance with paragraph (c) of this section with a nonjacketed thermal protective system and a separate tank head puncture resistance system (112T/114T) shall be retrofitted:
(i) With the tank head puncture resistance system not later than December 31, 1979; and
(ii) With thermal protection not later than December 31, 1980.
(3) All tank cars being retrofitted in accordance with paragraph (c) of this section with a thermal protective system enclosed in a metal jacket (112J 114J) shall be retrofitted such that—
(i) At least 20 percent of those cars owned on December 31, 1978, are so equipped by not later than that date;
(ii) At least 65 percent of those cars owned on December 31, 1979, are so equipped by not later than that date; and
(iii) All of those cars owned on December 31, 1980, are so equipped by not later than that date.

§ 179.105-4 Thermal protection. (a) *Performance standard.* Each specification 112T, 112J, 114T, and 114J tank car shall be equipped with a thermal protection system that prevents the release of any of the car's contents (except release through the safety relief valve) when subjected to:
(1) A pool fire for 100 minutes; and
(2) A torch fire for 30 minutes.
(b) *Test verification.* Except as provided in paragraph (c) of this section, compliance with the requirements of paragraph (a) of this section shall be verified by testing and analyzing the thermal protection system in accordance with paragraphs (d), (e), and (f) of this section. A complete record of each test verification shall be made, retained and, upon request, made available for inspection and copying by authorized representatives of the Department.
(c) *Excepted systems.* The Department maintains a list of thermal protection systems which comply with the requirements of paragraphs (d) and (e) of this section and which are excepted from the test verification requirement of paragraph (b) of this section. Information necessary to equip tank cars with one of these systems is available in the Dockets Branch, Room 8426 of the Nassif Building, 400 Seventh Street SW, Washington, D.C. 20590, between the hours of 8:30 a.m. and 5:00 p.m., Monday through Friday.
(d) *Simulated pool fire test.* (1) A pool fire environment shall be simulated in the following manner:
(i) The source of the simulated pool fire shall be a hydrocarbon fuel. The flame temperature from the simulated pool fire shall be at 1,600° F. plus-or-minus 100° F. throughout the duration of the test.
(ii) An uninsulated square steel plate with thermal properties equivalent to tank car steel shall be used. The plate dimensions shall be not less than one foot by one foot by nominal ⅜-inch thick. The plate shall be instrumented with not less than nine thermocouples to record the thermal response of the plate. The thermocouples shall be attached to the surface not exposed to the simulated pool fire, and shall be divided into nine equal squares with a thermocouple placed in the center of each square.
(iii) The pool fire simulator shall be constructed in a manner that results in total flame engulfment of the front surface of the bare plate. The apex of the flame shall be directed at the center of the plate.
(iv) The steel plate holder shall be constructed in such a manner that the only heat transfer to the back side of the plate is by heat conduction through the plate and not be other heat paths.
(v) Before the plate is exposed to the simulation pool fire, none of the temperature recording devices shall indicate the plate temperature in excess of 100° F. nor less than 32° F.
(vi) A minimum of two thermocouples devices shall indicate 800° F. after not less than 12 minutes nor more than 14 minutes of simulated pool fire exposure.
(2) A thermal insulation system shall be tested in the simulated pool fire environment described in paragraph (d) (1) of this section in the following manner:
(i) The thermal insulation system shall cover one side of a steel plate identical to that used to simulate a pool fire under paragraph (d) (1) (ii) of this section.
(ii) The uninsulated side of the steel plate shall be instrumented with not less than nine thermocouples placed as described in paragraph (d) (1) (ii) of this section to record the thermal response of the steel plate.
(iii) Before exposure to the pool fire simulation, none of the thermocouples on the thermal insulation system steel plate configuration shall indicate a plate temperature in excess of 100° F. nor less than 32° F.
(iv) The entire insulated surface of the thermal insulation system shall be exposed to the simulated pool fire.
(v) A pool fire simulation test shall run for a minimum of 100 minutes. The thermal insulation system shall retard the heat flow to the steel plate so that none of the thermocouples on the uninsulated side of the steel plate indicates a plate temperature in excess of 800° F.
(vi) A minimum of three consecutive successful simulation fire tests shall be performed for each thermal insulation system.
(e) *Simulated torch fire test.* (1) A torch fire environment shall be simulated in the following manner:
(i) The source of the simulated torch shall be a hydrocarbon fuel. The flame temperature from the simulated torch shall be 2,200° F. plus-or-minus 100° F. throughout the duration of the test. Torch velocities shall be 40 miles per hour plus-or-minus 10 miles per hour throughout the duration of the test.
(ii) An uninsulated square steel plate with thermal properties equivalent to tank car steel shall be used. The plate dimensions shall be not less than four feet by four feet by nominal ⅜-inch thick. The plate shall be instrumented with not less than nine thermocouples to record the thermal response of the plate. The thermocouples shall be attached to the surface not exposed to the simulated torch, and shall be divided into nine equal squares with a thermocouple placed in the center of each square.
(iii) The steel-plate holder shall be constructed in such a manner that the only heat transfer to the back side of the plate is by heat conduction through the plate and not by other heat paths. The apex of the flame shall be directed at the center of the plate.
(iv) Before exposure to the simulated torch, none of the temperature recording devices shall indicate a plate temperature in excess of 100° F. or less than 32° F.
(v) A minimum of two thermocouples shall indicate 800° F. in a time of 4.0 plus-or-minus 0.5 minutes of torch simulation exposure.
(2) A thermal insulation system shall be tested in the simulated torch fire environment described in paragraph (e) (1) of this section in the following manner:
(i) The thermal insulation system shall cover one side of a steel plate identical to that used to simulate a torch fire under paragraph (e) (1) (ii) of this section.
(ii) The back of the steel plate shall be instrumented with not less than nine thermocouples placed as described in paragraph (e) (1) (ii) of this section to record the thermal response of the steel.
(iii) Before exposure to the simulated torch, none of the thermocouples on the thermal insulation system steel plate configuration shall indicate a plate temperature in excess of 100° F. nor less than 32° F.
(iv) The entire outside surface of the thermal insulation system shall be exposed to the simulated torch fire environment.
(v) A torch simulation test shall be run for a minimum of 30 minutes. The thermal insulation system shall retard the heat flow to the steel plate so that none of the thermocouples on the uninsulated side of the steel plate indicates a plate temperature in excess of 800° F.
(vi) A minimum of two consecutive successful torch simulation tests shall be performed for each thermal insulation system.
(f) *Analysis.* The analysis required by paragraph (b) of this section must verify that the entire surface of the tank car, including discontinuous structures (e.g., stub sills, protective housings, etc.), complies with the requirements of paragraph (a) of this section.
(g) *Exterior tank color.* Notwithstanding the provisions of §179.101-1(a) Table, Note 4, each specification 112 and 114 tank car equipped with thermal protection that complies with the requirements of paragraph (a) of this section need not be painted white.

§ 179.105-5 Tank head puncture resistance. (a) *Performance standard.* Each specification 112S, 112T, 112J, 114S, 114T, and

114J tank car shall be capable of sustaining, without loss of contents, coupler-to-tank head impacts within the area of the tank head described in § 179.100-23 at relative car speeds of 18 miles per hour when:

(1) The weight of the impact car is at least 263,000 pounds.

(2) The impacted tank car is coupled to one or more "backup" cars which have a total weight of at least 480,000 pounds and the hand brakes are applied on the first car; and

(3) The impacted tank car is pressurized to at least 100 psi.

(b) *Test verification.* Compliance with the requirements of paragraph (a) of this section shall be verified by full scale testing or by the alternate test procedures prescribed in paragraph (c) of this section. However, protective head shields that meet the requirements of § 179.100-23 or full tank head jackets that are at least ½-inch thick and made from steels specified in § 179.100-23 (a) (1) need not be verified by testing.

(c) *Tank head puncture resistance test.* A tank head resistance system shall be tested under the following conditions.

(1) The ram car used shall weigh at least 263,000 pounds, be equipped with a coupler, and duplicate the condition of a conventional draft sill including the draft yoke and draft gear. The coupler shall protrude from the end of the ram car so that it is the leading location of perpendicular contact with the standing tank car.

(2) The impacted test car shall be loaded with water at six percent outage with internal pressure of at least 100 psi and coupled to one or more "backup" cars which have a total weight of 480,000 pounds with hand brakes applied on the first car.

(3) At least two separate tests shall be conducted with the coupler on the vertical centerline of the ram car. One test shall be conducted with the coupler at a height of 21 inches, plus-or-minus one-inch, above the top of the sill; the other test shall be conducted with the coupler height at 31 inches, plus-or-minus one-inch above the top of the sill. If the combined thickness of the tank head and any additional shielding material at any position over the area described in § 179.100-23 is less than the combined thickness on the vertical centerline of the car, a third test shall be conducted with the coupler positioned so as to strike the thinnest point.

(4) One of the following test procedures shall be applied:

Minimum weight of ram car plus attached cars (in pounds):	Minimum velocity of impact (in miles per hour)	Restriction
263,000	18	1 ram car only
343,000	16	1 ram car or 1 ram car plus 1 rigidly attached car
586,000	14	1 ram car plus 1 or more rigidly attached cars

(5) A test is successful if there is no visible leak from the standing tank car within one hour after impact.

§ 179.105-6 Coupler vertical restraint system. (a) *Performance standard.* Each specification 112 and 114 tank car shall be equipped with couplers capable of sustaining, without disengagement or material failure, vertical loads of at least 200,000 pounds applied in upward and downward directions in combination with buff loads of 2,000 pounds, when coupled to cars equipped with couplers that do have this vertical restraint capability, and cars equipped with couplers that do not have this vertical restraint capability.

(b) *Test verification and approval.* Except as provided in paragraph (d) of this section, compliance with the requirements of paragraph (a) of this section shall be achieved by verification testing of the coupler vertical restraint system in accordance with paragraph (c) of this section, and approval of the Federal Railroad Administrator.

(c) *Coupler vertical restraint tests.* A coupler vertical restraint system shall be tested under the following conditions:

(1) The test coupler shall be tested with: A mating coupler (or simulated coupler) having only frictional vertical force resistance at the mating interface; a mating coupler (or simulated coupler) having the capabilities described in paragraph (a) of this section.

(2) The testing apparatus shall simulate the vertical coupler performance at the mating interface and may not interfere with coupler failure or otherwise inhibit failure due to force applications and reactions.

(3) The test shall be conducted as follows:

(i) A minimum of 200,000 pounds vertical downward load shall be applied continuously for at least five minutes to the test coupler head simultaneously with the application of a nominal 2,000-pound buff load;

(ii) The procedures prescribed in paragraph (c) (3) (i) of this section shall be repeated with a minimum vertical upward load of 200,000 pounds;

(iii) A minimum of three consecutive successful tests shall be performed for each load combination prescribed in paragraphs (c) (3) (i) and (c) (3) (ii) of this section. A test is successful when a vertical disengagement or material failure does not occur during any of the prescribed load combinations.

(d) *Listing of approved couplers.* The following classes of couplers have been approved by the Federal Railroad Administrator and need not be verified by the testing requirements of paragraph (c) of this section:

(1) E top and bottom shelf couplers designated by the Association of American Railroads' Catalog No. SE60CHT, SE60CHTE, SE67BHT, SE67BHTE, SE68BHT or SE68BHTE; or

(2) F top shelf couplers designated by the Association of American Railroads' Catalog No. SF70CHT, SF70CHTE, SF73AHT, SF73AHTE, SF79CHT or SF79CHTE.

§ 179.105-7 Safety relief valves. (a) Notwithstanding the provisions of § 179.105-4, each 112 and 114 tank car shall be equipped with safety relief valves that meet the requirements of Appendix A of the AAR Specifications for Tank Cars. However, the relieving or discharge capacity shall be calculated in accordance with the formula prescribed in § A8.02 of Appendix A applicable to compressed gases in noninsulated tanks.

(b) The references in paragraph (a) of this section to Appendix A of the AAR Specifications for Tank Cars are to the 1976 edition of that publication.

(c) Notwithstanding paragraph (a) of this section, § 179.100-15, and § 179.200-18, the relieving or discharge capacity of the safety relief valve on a specification 105 or 111 tank car built to transport ethylene oxide may be as low as 1100 scfm at 85 psi if—

(1) The tank is equipped with a thermal protection system in accordance with § 179.105-4; and

(2) In all of the three consecutive simulation pool fire tests required by paragraph (d) of § 179.105-4, none of the thermocouples on the uninsulated side of the steel plate indicates a plate temperature in excess of 505°F.

(d) Notwithstanding paragraph (a) of this section, and §§ 179.100-15, 179.102-11, and 179.200-18, a specification 105 or 111 tank car built before March 1, 1984 to transport any flammable gas may use the currently installed safety relief valves, if—

(1) The tank car is equipped with a thermal protection system in accordance with § 179.105-4; and

(2) In all of the three consecutive simulation pool fire tests required by paragraph (d) of § 179.105-4, none of the thermocouples on the uninsulated side of the steel plate indicates a plate temperature in excess of 550°F.

§ 179.105-8 Stenciling. (a) Each 112 and 114 tank car that is equipped with a tank puncture resistance system as specified in § 179.105-5 shall have the letter "S" substituted for the "A" in the specification marking.

(b) Each 112 and 114 tank car that is equipped with a thermal protection system enclosed in a metal jacket shall have the letter "J" substituted for the "A" and "S" in the specification marking.

(c) Each 112 and 114 tank car that is equipped with a non-jacketed thermal protection system shall have the letter "T" substituted for the "A" and "S" in the specification marking.

§ 179.105-9 [Reserved]

§ 179.106 Special requirements for Specification 105 tank cars.

§ 179.106-1 General. (a) In addition to the requirements of this section, each tank car built under Specification 105 shall meet the applicable requirements of §§ 179.100, 179.101, 179.102 and 179.104.

(b) Notwithstanding the provisions of §§ 179.3, 179.4, and 179.6, AAR approval is not required for changes in or additions to Specification 105 tank cars in order to comply with this section.

(c) Notwithstanding the provisions of § 173.12a of this subchapter, no Specification 105 tank car manufactured to specifications promulgated by the Canadian Transport Commission may be used after February 28, 1982, to transport hazardous materials in the United States unless it is equipped with a coupler vertical restraint system that meets the requirements of § 179.105-6.

(d) Notwithstanding the provisions of § 173.12a of this subchapter, no Specification 105 tank car manufactured after August 31, 1981, to specifications promulgated by the Canadian Transport Commission, may be used to transport hazardous materials in the United States unless it is equipped in accordance with § 179.106-2.

(e) Notwithstanding the provisions of § 173.12a of this subchapter, no specification 105 tank car manufactured before September 1, 1981, to specifications promulgated by the Canadian Transport Commission having a water capacity (shell full volume, including manways) exceeding 18,500 U.S. gallons may be used after December 31, 1986, to transport hazardous materials unless it is equipped in accordance with § 179.106-3.

§ 179.106-2 New cars. (a) Each Specification 105A tank car built after February 28, 1981, shall be equipped with a coupler restraint system that meets the requirements of § 179.105-6.

(b) Each Specification 105S tank car built after August 31, 1981, shall be equipped with:

(1) A coupler restraint system that meets the requirements of § 179.105-6; and

(2) A tank head puncture resistance system that meets the requirements of §179.105-5.

(c) Each Specification 105J tank car built after August 31, 1981, shall be equipped with:

(1) A coupler restraint system that meets the requirements of §179.105-6;

(2) A tank head puncture resistance system that meets the requirements of §179.105-5;

(3) A thermal protection system that meets the requirements of §179.105-4; and

(4) A safety relief valve that meets the requirements of §179.105-7.

(d) Each Specification 105 tank car shall be stenciled as prescribed in §179.106-4.

§ 179.106-3 Previously built cars.

(a) Each specification 105A tank car built before March 1, 1931, shall be equipped with a coupler restraint system that meets the requirements of §179.105-6.

(b) Each specification 105S tank car built before September 1, 1931, shall be equipped with:

(1) A coupler restraint system that meets the requirements of §179.105-6; and

(2) A tank head puncture resistance system that meets the requirements of §179.105-5.

(c) Each specification 105J tank car built before September 1, 1981, shall be equipped with:

(1) A coupler restraint system that meets the requirements of §179.105-6;

(2) A thermal protection system that meets the requirements of §179.105-4;

(3) A safety relief valve that meets the requirements of §179.105-7; and

(4) A tank head puncture resistance system that meets the requirements of §179.105-5.

§ 179.106-4 Stenciling. (a) Each Specification 105 tank car that is equipped with a coupler restraint system that meets the requirements of §179.105-6 and a tank head puncture resistance system that meets the requirements of §179.105-5 shall be stenciled by having the letter "S" substituted for the letter "A" in the specification marking.

(b) Each Specification 105 tank car that is equipped with a coupler restraint system that meets the requirements of §179.105-6, a tank head puncture resistance system that meets the requirements of §179.105-5, a thermal protection system that meets the requirements of §179.105-6, and a safety relief valve that meets the requirements of §179.105-7, shall be stenciled by having the letter "J" substituted for the letter "A" in the specification marking.

SUBPART D

SPECIFICATIONS FOR NON-PRESSURE TANK CAR TANKS (CLASSES DOT-103, 104, 111AF, 111AW, AND 115AW)

§ 179.200 General specifications applicable to nonpressure tank car tanks (Classes DOT-103, 104, and 111).

§ 179.200-1 Tanks built under these specifications must meet the requirements of §§179.200, 179.201, and when applicable §179.202.

§ 179.200-2 Approval. (a) For procedure for securing approval, see §179.3.

§ 179.200-3 Type. (a) Tank built under these specifications must be circular in cross section, with formed heads designed convex outward. When specified in §179.201-1, the tank must have at least one manway or one expansion dome with manway, and such other external projections as are prescribed herein. When the tank is divided into compartments, each compartment must be treated as a separate tank.

§ 179.200-4 Insulation. (a) If insulation is applied, the tank shell and expansion dome when used must be insulated with an approved material. The entire insulation must be covered with a metal jacket of a thickness not less than 11 gage (0.1196 inch) nominal (Manufacturer's Standard Gage) and flashed around all openings so as to be weather tight. The exterior surface of a carbon steel tank and the inside surface of a carbon steel jacket must be given a protection coating, except that protective coating is not required when foam-in-place insulation that adheres to the tank or jacket is applied.

(b) If insulation is a specification requirement, it shall be of sufficient thickness so that the thermal conductance at 60° F. is not more than 0.225 Btu. per hour, per square foot, per degree F. temperature differential, unless otherwise provided in §179.201-1. If exterior heaters are attached to tank, the thickness of the insulation over each heater element may be reduced to one-half that required for the shell.

§ 179.200-5 Bursting pressure. (a) The minimum required bursting pressure is listed in §179.201-1.

§ 179.200-6 Thickness of plates. (a) The wall thickness after forming of the tank shell, dome shell, and of 2:1 ellipsoidal heads must be not less than specified in §179.201-1, nor that calculated by the following formula:

$$t = \frac{Pd}{2SE}$$

where:

d = Inside diameter in inches;
E = 0.9 Welded joint efficiency; except E = 1.0 for seamless heads;
P = Minimum required bursting pressure in p.s.i.;
S = Minimum tensile strength of plate material in p.s.i. as prescribed in §179.200-7;
t = Minimum thickness of plate in inches after forming.

(b) The wall thickness after forming of 3:1 ellipsoidal heads must be not less than specified in §179.201-1, nor that calculated by the following formula:

$$t = \frac{Pd}{2SE} \times 1.83$$

where:

d = Inside diameter in inches;
E = 0.9 Welded joint efficiency; except E = 1.0 for seamless heads;
P = Minimum required bursting pressure in p.s.i.;
S = Minimum tensile strength of plate material in p.s.i. as prescribed in §179.200-7;
t = Minimum thickness of plate in inches after forming.

(c) The wall thickness after forming of a flanged and dished head must be not less than specified in §179.201-1, nor that calculated by the following formula:

$$t = \frac{5PL}{6SE}$$

where:

E = 0.9 Welded joint efficiency; except E = 1.0 for seamless heads;
L = Main inside radius to which head is dished, measured on concave side in inches;
P = Minimum required bursting pressure in p.s.i.;
S = Minimum tensile strength of plate material in p.s.i. as prescribed in §179.200-7;
t = minimum thickness of plate in inches after forming.

(d) If plates are clad with material having tensile strength properties at least equal to the base plate, the cladding may be considered a part of the base plate when determining thickness. If cladding material does not have tensile strength at least equal to the base plate, the base plate alone must meet the thickness requirements.

(e) For a tank constructed of longitudinal sections, the minimum width of bottom sheet of the tank must be 60 inches measured on the arc, but in all cases the width must be sufficient to bring the entire width of the longitudinal welded joint, including welds, above the bolster.

(f) For a tank built of one piece cylindrical sections the thickness specified for bottom sheet must apply to the entire cylindrical section.

(g) See §179.200-9 for thickness requirements for a compartmented tank.

§ 179.200-7 Materials. (a) Plate material used to fabricate the tank and, when used, expansion dome or manway nozzle material, must meet one of the following specifications with the indicated minimum tensile strength and elongation in the welded condition.

(b) Carbon steel plate: The maximum allowable carbon content must be 0.31 percent when the individual specification allows carbon content greater than this amount. The plates may be clad with other approved materials:

Specifications	Minimum tensile strength (p.s.i.) welded condition[1]	Minimum elongation in 2 inches (percent) weld metal (longitudinal)
ASTM A 515-70, Gr. 55	55,000	28
ASTM A 515-70, Gr. 60	60,000	25
ASTM A 515-70, Gr. 65	65,000	20
ASTM A 515-70, Gr. 70	70,000	20
ASTM A 285-70a, Gr. A	45,000	29
ASTM A 285-70a, Gr. B	50,000	20
ASTM A 285-70a, Gr. C	55,000	20
ASTM A 516-70a, Gr. 55	55,000	28
ASTM A 515-70a, Gr. 60	60,000	25
ASTM A 516-70a, Gr. 65	65,000	20
ASTM A 516-70a, Gr. 70	70,000	20
AAR TC128-70, Gr. A and B	81,000	13

[1] Maximum stresses to be used in calculations.

(c) Aluminum alloy plate: Aluminum alloy plate must be suitable for welding and comply with one of the following specifications:

Specifications	Minimum tensile strength (p.s.i.) welded condition[2][3]	Minimum elongation in 2 inches (percent) 0 temper weld metal (longitudinal)
ASTM B 209-70, Alloy 5052[1]	25,000	18
ASTM B 209-70, Alloy 5083[2]	38,000	16
ASTM B 209-70, Alloy 5086[1]	35,000	14
ASTM B 209-70, Alloy 5154[1]	30,000	18
ASTM B 209-70, Alloy 5254[1]	30,000	18
ASTM B 209-70, Alloy 5454[1]	31,000	18
ASTM B 209-70, Alloy 5652[1]	25,000	18
ASTM B 209-70, Alloy 6061[4]	24,000	5[5]

[1] For fabrication, the parent plate material may be 0, H112, or H32 temper, but design calculations must be based on minimum tensile strength shown.
[2] 0 temper only.
[3] Weld filler metal 5556 must not be used.
[4] Not authorized for tank shells, manways or domes.
[5] 6 temper only.
[6] Maximum stress to be used in calculations.

(d) High alloy steel plate: High alloy steel plate must comply with one of the following specifications:

Specifications	Minimum tensile strength (p.s.i.) welded condition[1]	Minimum elongation in 2 inches (percent) weld metal (longitudinal)
ASTM A240-70, Type 304	75,000	30
ASTM A240-70, Type 304L	70,000	30
ASTM A240-70, Type 316	75,000	30
ASTM A240-70, Type 316L	70,000	30

[1] Maximum stresses to be used in calculations.
[2] High alloy steel materials used to fabricate tank and expansion dome, when used, must be tested in accordance with the following procedures in ASTM Specification A262-68 titled, "Recommended Practices for Detecting Susceptibility to Intergranular Attack in Stainless Steels," and must exhibit corrosion rates not exceeding the following:

Test procedures	Material	Corrosion rate i.p.m.
Practice B	Types 304, 304L, 316, and 316L	0.0040
Practice C	Type 304L	.0020

Type 304L and Type 316L test specimens must be given a sensitizing treatment prior to testing. (A typical sensitizing treatment is 1 hour at 1,250 F).

(e) Nickel plate: Nickel plate must comply with the following specification:

Specifications	Minimum tensile strength (p.s.i.) welded condition[1]	Minimum elongation in 2 inches (percent) weld metal (longitudinal)
ASTM B162-69[2]	40,000	20

[1] Maximum stresses to be used in calculations.
[2] When used as cladding for carbon steel plate, low carbon nickel is required.

(f) Manganese-molybdenum steel plate: Manganese-molybdenum steel plate must be suitable for fusion welding and comply with the following specification:

Specifications	Minimum tensile strength (p.s.i.) welded condition[1]	Minimum elongation in 2 inches (percent) weld metal (longitudinal)
ASTM A302-69a Gr. B	80,000	20

[1] Maximum stresses to be used in calculations.

(g) All parts and items of construction in contact with the lading must be made of material compatible with plate material and not subject to rapid deterioration by the lading, or be coated or lined with suitable corrosion resistant material.

(h) All external projections which may be in contact with the lading and all castings, forgings, or fabrications used for fittings or attachments to tank and expansion dome, when used, in contact with lading must be made of material to an approved specification. See AAR Specifications for Tank Cars, Appendix M, M-1.05 for approved material specifications for castings for fittings.

§ 179.200-8 Tank heads. (a) All external tank heads must be an ellipsoid of revolution in which the major axis must equal the diameter of the shell and the minor axis must be one-half the major axis.

(b) Internal compartment tank heads may be 2:1 ellipsoidal, 3:1 ellipsoidal, or flanged and dished to thicknesses as specified in § 179.200-6. Flanged and dished heads must have main inside radius not exceeding 10 feet, and inside knuckle radius must not be less than 3 ¾ inches for steel, alloy steel, or nickel tanks, and not less than 5 inches for aluminum alloy tanks.

§ 179.200-9 Compartment tanks. (a) When a tank is divided into compartments, by inserting interior heads, interior heads must be inserted in accordance with AAR Specifications for Tank Cars, Appendix E, E-7.00, and must comply with the requirements specified in § 179.201-1. Voids between compartment heads must be provided with at least one tapped drain hole at their lowest point, and a tapped hole at the top of the tank. Top hole must be closed, and the bottom hole may be closed, with not less than three-fourths inch nor more than 1½ inches solid pipe plugs having NPT threads.

(b) When the tank is divided into compartments by constructing each compartment as a separate tank, these tanks shall be joined together by a cylinder made of plate, having a thickness not less than that required for the tank shell and applied to the outside surface of tank head flanges. The cylinder shall fit the straight flange portion of the compartment tank head tightly. The cylinder shall contact the head flange for a distance of at least two times the plate thickness, or a minimum of 1 inch, whichever is greater. The cylinder shall be joined to the head flange by a full fillet weld. Distance from head seam to cylinder shall not be less than 1½ inches or three times the plate thickness, whichever is greater. Voids created by the space between heads of tanks joined together to form a compartment tank shall be provided with a tapped drain hole at their lowest point and a tapped hole at top of tank. The top hole shall be closed and the bottom hole may be closed with solid pipe plugs not less than ¾ inch nor more than 1½ inches having NPT threads.

§ 179.200-10 Welding. (a) All joints shall be fusion-welded in compliance with the requirements of AAR Specifications for Tank Cars, Appendix W. Welding procedures, welders and fabricators shall be approved.

(b) Welding is not permitted on or to ductile iron or malleable iron fittings.

§ 179.200-11 Postweld heat treatment. After welding is complete, postweld heat treatment must be in compliance with the requirements of AAR Specifications for Tank Cars, Appendix W, when specified in § 179.201-1.

§ 179.200-12 Tank mounting. See § 179.10.

§ 179.200-13 Manway ring or flange, safety relief device flange, bottom outlet nozzle flange, bottom washout nozzle flange and other attachments and openings. (a) These attachments shall be fusion welded to the tank and reinforced in an approved manner in compliance with the requirements of Appendix E, figure 10, of the AAR Specifications for Tank Cars.

(b) The opening in the manway ring must be at least 16 inches in diameter except that acid resistant lined manways must be at least 18 inches in diameter before lining.

(c) The manway ring or flange, shall be made of cast, forged or fabricated metal. The metal of the dome, tank, or nozzle must be compatible with the manway ring or flange, so that they may be welded together.

(d) The openings for the manway or other fittings shall be reinforced in an approved manner.

§ 179.200-14 Expansion capacity. (a) Tanks shall have expansion capacity as prescribed in § 179.201-1. This capacity shall be provided in the tank for Class DOT-111A cars, or in a dome for Class DOT-103 and 104 type cars.

(b) The capacity of the expansion dome, when used, shall be at least the percentage specified in § 179.201-1 of the total capacity of the tank and dome combined. The capacity of the dome shall be measured from the inside top of shell of tank to the inside top of dome or bottom of any vent pipe projecting inside of dome, except that when safety relief device is applied to side of dome, the effective capacity of the dome shall be measured from top of safety relief device opening inside of dome to inside top of shell of tank.

(c) The opening in the tank shell within the dome shall be at least 29 inches in diameter. When the opening in the tank shell exceeds 30

inches in diameter, the opening shall be reinforced in an approved manner. This additional reinforcement may be accomplished by the use of a dome opening of the flued-type as shown in Appendix E, Figure E 10C of the AAR Specifications for Tank Cars or by the use of reinforcing as outlined in Appendix E, E3 04 and Figures E10K and E10L. When the opening in the tank shell is less than the inside diameter of the dome, and the dome pocket is not closed off in an approved manner, dome pocket drain holes shall be provided in the tank shell with nipples projecting inside the tank at least 1 inch.

(d) The dome head shall be of approved contour and shall be designed for pressure on concave side.

(e) Aluminum alloy domes:

(1) The dome shell thickness shall be calculated by the formula in §179.200-6(a).

(2) The dome head may be an ellipsoid of revolution in which the major axis shall be equal to the diameter of the dome shell and the minor axis shall be one-half the major axis. The thickness in this case shall be determined by using formula in §179.200-6(a).

(3) The dome head, if dished, must be dished to a radius not exceeding 96 inches. Thickness of dished dome head must be calculated by the formula in §179.200-6(c).

(4) Tank shell shall be reinforced by the addition of a plate equal to or greater than shell in thickness and the cross sectional area shall exceed metal removed for dome opening, or tank shell shall be reinforced by a seamless saddle plate equal to or greater than shell in thickness and butt welded to tank shell. The reinforcing saddle plate shall be provided with a fluid opening having a vertical flange of the diameter of the dome for butt welding shell of dome to the flange. The reinforcing saddle plate shall extend about the dome a distance measured along shell of tank at least equal to the extension at top of tank. Other approved designs may be used.

(f) For thickness of carbon or alloy steel domes, see §179.201-2.

§ 179.200-15 Closures for manways. (a) Manway covers must be of approved type.

(b) Manway covers shall be designed to provide a secure closure of the manway.

(c) Manway covers must be of approved cast, forged, or fabricated metals. Malleable iron, if used, must comply with ASTM A47-68, Grade 35018. Cast iron manway covers must not be used.

(d) All joints between manway covers and their seats shall be made tight against leakage of vapor and liquid by use of gaskets of suitable material.

(e) For other manway cover requirements see §179.201-1.

§ 179.200-16 Gaging devices, top loading and unloading devices venting and air inlet devices. (a) When installed, these devices shall be of an approved design which will prevent interchange with any other fixture, and be tightly closed. Unloading pipes shall be securely anchored within the tank. Each tank or compartment may be equipped with one separate air connection.

(b) When the characteristics of the commodity for which the car is authorized are such that these devices must be equipped with valves or fittings to permit the loading and unloading of the contents, these devices, including valves, shall be of an approved design, and be provided with a protective housing except when plug or ball type valves with operating handles removed are used. Provision shall be made for closing pipe connections of valves.

(c) A tank may be equipped with a vacuum relief valve of an approved design. Protective housing is not required.

(d) When gaging device is required in §179.201-1, an outage scale visible through manway opening shall be provided. If loading devices are applied to permit tank loading with cover closed, a telltale pipe may be provided. Telltale pipe shall be capable of determining that required outage is provided. Pipe shall be equipped with ¼ inch minimum NPT control valve mounted outside tank and enclosed within a housing. Other approved devices may be used in lieu of outage scale or telltale pipe.

(e) Bottom of tank shell may be equipped with a sump or siphon bowl, or both, welded or pressed into the shell. Such sumps or siphon bowls, if applied, are not limited in size and must be made of cast, forged, or fabricated metal. Each sump or siphon bowl must be of good welding quality in conjunction with the metal of the tank shell. When sump or siphon bowl is pressed in the bottom of the tank shell, the wall thickness of the pressed section must not be less than that specified for the shell. The section of a circular cross section tank to which a sump or siphon bowl is attached need not comply with the out-of-roundness requirement specified in Appendix W, W14.06, of the AAR Specifications for Tank Cars. Any portion of a sump or siphon bowl not forming a part of a cylinder of revolution must have walls of such thickness and be so reinforced that the stresses in the walls caused by a given internal pressure are not greater than the circumferential stress which would exist under the same internal pressure in the wall of a tank of circular cross section designed in accordance with §179.200-6(a) and (d). In no case shall the wall thickness be less than that specified in §179.201-1(a).

(f) When top loading and discharge devices, or venting and air inlet devices are installed with exposed piping to a removed location, shutoff valves must be applied directly to reinforcing pads or nozzles at their communication through the tank shell, and must be enclosed in a protective housing with provision for a seal. The piping must include breakage grooves, and suitable bracing. Relief valves must be applied to liquid lines for protection in case lading is trapped. Provision must be made to insure closure of the valves while the car is in transit.

(g) Protective housing, when required, must be fabricated of approved material and have cover and sidewalls not less than 0.119 inch in thickness.

§ 179.200-17 Bottom outlets. (a) If indicated in §179.201-1, tank may be equipped with bottom outlet. Bottom outlet, if applied, must comply with the following requirements:

(1) The extreme projection of the bottom outlet equipment may not be more than that allowed by Appendix E of the AAR Specifications for Tank Cars. All bottom outlet reducers and closures and their attachments shall be secured to the car by at least ⅜-inch chain, or its equivalent, except that the bottom outlet closure plugs may be attached by ¼-inch chain. When the bottom outlet closure is of the combination cap and valve type, the pipe connection to the valve shall be closed by a plug, cap, or approved quick coupling device. The bottom outlet equipment should include only the valve, reducers and closures that are necessary for the attachment of unloading fixtures. The permanent attachment of supplementary exterior fittings shall be approved by the AAR Committee on Tank Cars.

(2) Bottom outlet must be of approved construction, and be provided with a liquid-tight closure at its lower end.

(3) On cars with center sills, a ball valve may be welded to the outside bottom of the tank or mounted on a pad or nozzle with a longue and groove or male and female flange attachment. In no case shall the breakage groove or equivalent extend below the bottom flange of the center sill. On cars without continuous center sills, a ball valve may be welded to the outside bottom of the tank or mounted with a longue and groove or male and female flange attachment on a pad attached to the outside bottom of the tank. The mounting pad must have a maximum thickness of 2½ inches measured on the longitudinal centerline of the tank. The valve operating mechanism must be provided with a suitable locking arrangement to insure positive closure during transit.

(4) The valve operating mechanism for valves applied to the interior of the tank, and outlet nozzle construction, must insure against the unseating of the valve due to stresses or shocks incident to transportation.

(5) Bottom outlet nozzle of interior valves and the valve body of exterior valves, must be of cast, fabricated, or forged metal. If welded to tank, they must be of good weldable quality in conjunction with metal of tank.

(6) To provide for the attachment of unloading connections, the discharge end of the bottom outlet nozzle or reducer, the valve body of the exterior valve, or some fixed attachment thereto, shall be provided with one of the following arrangements or an approved modification thereof. (See Appendix E, Fig. E17 of the AAR Specifications for Tank Cars for illustrations of some of the possible arrangements.)

(i) A bolted flange closure arrangement including a minimum 1-inch NPT pipe plug (see Fig. E17.1) or including an auxiliary valve with a threaded closure.

(ii) A threaded cap closure arrangement including a minimum 1-inch NPT pipe plug (see Fig. E17.2) or including an auxiliary valve with a threaded closure.

(iii) A quick-coupling device using a threaded plug closure of at least 1-inch NPT or having a threaded cap closure with a minimum 1-inch NPT pipe plug (see Fig. E17.3 through E17.5). A minimum 1-inch auxiliary test valve with a threaded closure may be substituted for the 1-inch pipe plug (see Fig. E17.6). If the threaded cap closure does not have a pipe plug or integral auxiliary test valve, a minimum 1-inch NPT pipe plug shall be installed in the outlet nozzle above the closure (see Fig. E17.7).

(iv) A two-piece quick-coupling device using a clamped dust cap must include an in-line auxiliary valve, either integral with the quick-coupling device or located between the primary bottom outlet valve and the quick-coupling device. The quick-coupling device closure dust cap or outlet nozzle shall be fitted with a minimum 1-inch NPT closure (see Fig. E17.8 and E17.9).

(7) If the outlet nozzle extends 6 inches or more from the shell of the tank, a V-shaped breakage groove shall be cut (not cast) in the upper part of the outlet nozzle at a point immediately below the lowest part of valve closet to the tank. In no case may the nozzle wall thickness at the root of the "V" be more than ¼ inch. The outlet nozzle on interior valves or the valve body on exterior valves may be steam jacketed, in which case the breakage groove or its equivalent must be below the steam chamber but above the bottom of center sill construction. If the outlet nozzle is not a single piece, or if exterior valves are applied, provisions shall be made for the equivalent of the breakage groove. On cars without continuous center sills, the breakage groove or its equivalent must be no more than 15 inches below the tank shell. On cars with continuous center sills, the breakage groove or its equivalent must be above the bottom of the center sill construction.

(3) The flange on the outlet nozzle or the valve body of exterior valves must be of a thickness which will prevent distortion of the valve seat or valve by any change in contour of the shell resulting from expansion of lading, or other causes, and which will insure that accidental breakage of the outlet nozzle will occur at or below the "V" groove, or its equivalent.

(9) The valve must have no wings or stem projecting below the "V" groove or its equivalent. The valve and seal must be readily accessible or removable for repairs, including grinding.

(10) The valve operating mechanism on interior valves must have means for compensating for variation in the vertical diameter of the tank produced by expansion, weight of the liquid contents, or other causes, and may operate from the interior of the tank, but in the event the rod is carried through the dome, or tank shell, leakage must be prevented by packing in stuffing box or other suitable seals and a cap.

(b) If indicated in § 179.201-1, tank may be equipped with bottom washout of approved construction. If applied, bottom washout shall be in accordance with the following requirements:

(1) The extreme projection of the bottom washout equipment may not be more than that allowed by Appendix E of the AAR Specifications for Tank Cars.

(2) Bottom washout shall be of cast, forged or fabricated metal. If welded to tank, they shall be of good weldable quality in conjunction with metal of tank.

(3) If the washout nozzle extends 6 inches or more from the shell of the tank, a V-shaped breakage groove shall be cut (not cast) in the upper part of the nozzle at a point immediately below the lowest part of the inside closure seat or plug. In no case may the nozzle wall thickness at the root of the "V" be more than ¼ inch. Where the nozzle is not a single piece, provisions shall be made for the equivalent of the breakage groove. The nozzle must be of a thickness to insure that accidental breakage will occur at or below the "V" groove or its equivalent. On cars without continuous center sills, the breakage groove or its equivalent may not be more than 15 inches below the outer shell. On cars with continuous center sills, the breakage groove or its equivalent must be above the bottom of the center sill construction.

(4) The closure plug and seat must be readily accessible or removable for repairs, including grinding.

(5) The closure of the washout nozzle must be equipped with a ¾-inch solid screw plug. Plug must be attached by at least a ¼-inch chain.

(6) Joints between closures and their seats may be gasketed with suitable material.

§ 179.200-18 Safety relief devices. (a) Safety relief valves.

(1) When permitted in § 179.201-1, each tank or compartment shall be equipped with one or more safety relief valves of approved design, made of metal not subject to rapid deterioration by the lading, and mounted on expansion dome of Class DOT-103 or 104 cars or top of tank shell of Class DOT-111A cars. Total valve discharge capacity shall be sufficient to prevent building up of pressure in the tank to more than 10 psi. above start-to-discharge pressure. See AAR Specifications for Tank Cars, Appendix A, for formula for calculating discharge capacity.

(2) The start-to-discharge pressures and vapor tight pressures shall comply with § 179.201-1.

(b) Safety vents:

(1) When permitted in § 179.201-1, each tank or compartment used for the transportation of corrosive liquids, flammable solids, oxidizing materials, or poisonous liquids or solids, Class B, need not be equipped with safety relief valves, but if not so equipped, shall have one safety vent at least 1¼ inches inside diameter, of an approved design which will prevent interchange with fixtures prescribed in § 179.200-16(a), and closed with a frangible disc of lead or other approved material of a thickness that will rupture at not more than 100 percent of tank test pressure. Means for holding disc in place shall be such as to prevent distortion or damage to disc when applied. Safety vent closure shall be chained or otherwise fastened to prevent misplacement. All tanks equipped with vents shall be stenciled "NOT FOR FLAMMABLE LIQUIDS."

§ 179.200-19 Reinforcements, when used, and appurtenances not otherwise specified. (a) All attachments to tank and dome shall be applied by approved means. Rivets if used shall be caulked inside and outside.

(b) Reinforcing pads must be used between external brackets and shells if the attachment welds exceed 6 lineal inches of ¼-inch fillet or equivalent weld per bracket or bracket leg. When reinforcing pads are used, they must not be less than one-fourth inch in thickness, have each corner rounded to a 1 inch minimum radius, and be attached to the tank by continuous fillet welds except for venting provisions. The ultimate shear strength of the bracket to reinforcing pad weld must not exceed 65 percent of the ultimate shear strength of the reinforcing pad to tank weld.

§ 179.200-20 Interior heater systems. (a) See § 179.12.

§ 179.200-21 Closures for openings. (a) All plugs shall be solid, with NPT threads, and shall be of a length which will screw at least 6 threads inside the face of fitting or tank. Plugs, when inserted from the outside of tank heads, shall have the letter "S" at least ⅜ inch in size stamped with steel stamp or cast on the outside surface to indicate the plug is solid.

§ 179.200-22 Test of tanks. (a) Each tank shall be tested by completely filling the tank and dome or nozzles with water, or other liquid having similar viscosity, of a temperature which shall not exceed 100° F. during the test; and applying the pressure prescribed in § 179.201-1. Tank shall hold the prescribed pressure for at least 10 minutes without leakage or evidence of distress. All rivets and closures, except safety relief valves or safety vents, shall be in place when test is made.

(b) Insulated tanks shall be tested before insulation is applied.

(c) Rubber-lined tanks shall be tested before rubber lining is applied.

(d) Caulking of welded joints to stop leaks developed during the foregoing tests is prohibited. Repairs in welded joints shall be made as prescribed in AAR Specifications for Tank Cars, Appendix W.

§ 179.200-23 Tests of safety relief valves. (a) Each valve shall be tested by air or gas for compliance with § 179.201-1 before being put in service.

§ 179.200-24 Stamping. (a) To certify that the tank complies with all specification requirements, each tank shall be plainly and permanently stamped in letters and figures at least ⅜ inch high into the metal near the center of both outside heads as follows:

	Example of required stamping
SPECIFICATION	DOT-103-W
MATERIAL	ASTM A285 C
CLADDING MATERIAL (if any)	ASTM A240-304 Clad
TANK BUILDER'S INITIALS	ABC
DATE OF ORIGINAL TEST	00-0000
CAR ASSEMBLER (if other than tank builder)	DEF

(b) On Class DOT-111 tank cars, the last numeral of the specification number may be omitted from the stamping; for example, DOT-111A100W.

§ 179.200-25 Stenciling. (a) The tank, or the jacket if tank is insulated, shall be stenciled in compliance with the requirements of AAR Specifications for Tank Cars, Appendix C.

§ 179.200-26 Certificate of construction. (a) See § 179.5.

§ 179.200-27 Alternative requirements for tank head puncture resistance systems.

Class DOT 111 tank cars required to have puncture resistance systems in accordance with § 179.105-5 may, as an alternative, be equipped with a head shield at each end of the car conforming to the requirements of § 179.100-23.

§ 179.201 Individual specification requirements applicable to non-pressure tank car tanks.

§ 179.201-1 Individual specification requirements. (a) In addition to § 179.200 the individual specification requirements are as follows:

[1] Tanks converted to DOT-111A series from existing forge welded specification DOT-105A300, 400, or 500 tanks, by modification using conversion details complying with DOT-111A specification requirements, shall be stenciled by substituting the letter "F" for the letter "W" in the specification designation.

[2] See § 173.314(c) of this subchapter for compressed gases and § 173.118 of this subchapter for flammable liquids, unless otherwise specified in Part 173, Subpart C.

§ 179.201-2 Minimum plate thickness. (a) The minimum plate thickness after forming must be as follows:

Inside diameter of tanks	Bottom sheets (inch)	Shell sheets (inch)	Expansion dome sheets (inch)	2:1 Ellipsoidal heads (inch)	3:1 Ellipsoidal and dished tank heads (inch)	Expansion dome heads (inch)	Interior compartment heads (inch)
60 inches or under	7/16	1/2	5/16	7/16	1/2	5/16	5/16
Over 60 to 78 inches	7/16	9/16	5/16	7/16	1/2	5/16	5/16
Over 78 to 96 inches	1/2[1]	5/8	5/16	7/16	1/2	5/16	3/8
Over 96 to 112 inches	1/2[1]	7/16	5/16	7/16	9/16	5/16	7/16
Over 112 to 122 inches	1/2	1/2	5/16	1/2	5/8	5/16	1/2

[1] May be reduced to 7/16 inch when approved steels having tensile strength of 65,000 psi or higher are used.

§ 179.201-3 Lined tanks. (a) Rubber-lined tanks.

(1) Each tank or each compartment thereof must be lined with acid-resistant rubber or other approved rubber compound vulcanized or bonded directly to the metal tank, to provide a non-porous laminated lining, at least 5/32-inch thick, except over all rivets and seams formed by riveted attachments in the lining must be double thickness. The rubber lining must overlap at least 1½ inches at all edges which must be straight and be beveled to an angle of approximately 45°, or butted edges of lining must be sealed with a 3-inch minimum strip of lining having 45° beveled edges.

(2) As an alternate method, the lining may be joined with a skived butt seam then capped with a separate strip of lining 3 inches wide having 45° beveled edges. An additional rubber reinforcing pad at least 4½ feet square and at least 1/8-inch thick must be applied by vulcanizing to the lining on bottom of tank directly under the manway opening. The edges of the rubber pad must be beveled to angle of approximately 45°. An opening in this pad for sump is permitted. No lining must be under tension when applied except due to conformation over rivet heads. Interior of tank must be free from scale, oxidation, moisture, and all foreign matter during the lining operation.

(3) Other approved lining materials may be used provided the material is resistant to the corrosive or solvent action of the lading in the liquid or gas phase and is suitable for the service temperatures.

(b) Before a tank car tank is lined with rubber, or other rubber compound, a report certifying that the tank and its equipment have been brought into compliance with spec. DOT-103B, 103B-W, 111A60W-5, or 111A100W-5 must be furnished by car owner to the party who is to apply the lining. A copy of this report in approved form, certifying that tank has been lined in compliance with all requirements of one of the above specifications, must be furnished by party lining tank to car owner. Reports of the latest lining application must be retained by the car owner until the next relining has been accomplished and recorded.

(c) All rivet heads on inside of tank must be buttonhead, or similar shape, and of uniform size. The under surface of heads must be driven tight against the plate. All plates, castings and rivet heads on the inside of the tank must be caulked. All projecting edges of plates, castings and rivet heads on the inside of the tank must be rounded and free from fins and other irregular projections. Castings must be free from porosity.

(d) All surfaces of attachments or fittings and their closures exposed to the lading must be covered with at least 1/8-inch acid resistant material. Attachments made of metal not affected by the lading need not be covered with rubber or other acid resistant material.

(e) Hard rubber or polyvinyl chloride may be used for pressure retaining parts of safety vents provided the material is resistant to the corrosive or solvent action of the lading in the liquid or gas phase and is suitable for the service temperatures.

(f) Polyvinyl chloride lined tanks. Tank car tanks or each compartment thereof may be lined with elastomeric polyvinyl chloride having a minimum lining thickness of three thirty-seconds inch.

(g) Polyurethane lined tanks. Tank car tanks or each compartment thereof may be lined with elastomeric polyurethane having a minimum lining thickness of one-sixteenth inch.

§ 179.201-4 Material. All fittings, tubes, and castings and all projections and their closures, except for protective housing, must also meet the requirements specified in AAR Specifications for Tank Cars, Appendix M, M3.03(b) and M4.05(d).

§ 179.201-5 Postweld heat treatment and corrosion resistance. (a) Tanks and attachments welded directly thereto must be postweld heat treated as a unit at the proper temperature except as indicated below. Tanks and attachments welded directly thereto fabricated from ASTM A240-70 Type 430A, Type 304 and Type 316 materials must be postweld heat treated as a unit and must be tested to demonstrate that they possess the corrosion resistance specified in § 179.200-7(d), Footnote 2. Tanks and attachments welded directly thereto, fabricated from ASTM A 240-70 Type 304L or Type 316L materials are not required to be postweld heat treated.

(b) Tanks and attachments welded directly thereto, fabricated from ASTM A240-70 Type 304L and Type 316 materials must be tested to demonstrate that they possess the corrosion resistance specified in § 179.200-7(d), Footnote 2.

§ 179.201-6 Manways and manway closures. (a) The manway cover for spec. DOT-103ALW, 103DW, 103W, 104W,

111A60ALW1, 111A60W1, 111A100ALW1, 111A100W1, 111A100W3, or 111A100W5 must be designed to make it impossible to remove the cover while the interior of the tank is subjected to pressure.

(b) The manway cover for spec. DOT-103BW, 111A60W5, or 111A100W5 must be made of a suitable metal. The top, bottom and edge of manway cover must be acid resistant material covered as prescribed in §179.201-3. Through-bolt holes must be lined with acid resistant material at least one-eighth inch in thickness. Cover made of metal not affected by the lading need not be acid resistant material covered.

(c) The manway ring and cover for spec. DOT-103CW, 103DW, 103EW, 111A60W7, or 111A100W6 must be made of the metal and have the same inspection procedures specified in AAR Specifications for Tank Cars Appendix M, M3.03.

(d) The manway ring for DOT-103 AW must be made of cast, forged or fabricated nickel and be a good weldable quality in conjunction with the metal of the dome. Manway cover must be made of nickel.

§ 179.201-7 Safety relief devices. (a) Each tank or compartment must be equipped with a safety vent unless characteristics of the lading require a safety relief valve. These devices must comply with §179.200-18.

(b) Safety vents, if used, shall be of approved design, at least 1¼ inches inside diameter, made of material not subject to rapid deterioration by the lading, and closed with a frangible disc of lead or other approved material of a thickness that will burst at not more than 100 percent of tank test pressure. Means for holding the disc in place shall be such as to prevent distortion or damage to the disc when applied. The safety vent closure shall be chained or otherwise fastened to prevent misplacement.

(c) Safety relief valves, if used, shall be of approved design, made of metal not subject to rapid deterioration by the lading, and mounted on expansion dome of Class DOT-103 and 104 type tanks, or top of tank shell for Class DOT-111A type tanks.

§ 179.201-8 Sampling device and thermometer well. (a) Sampling valve and thermometer well are not specification requirements. When used, they must be of approved design, made of metal not subject to rapid deterioration by lading, and must withstand a pressure of 100 pounds per square inch without leakage. Interior pipes of the sampling valve must be equipped with excess flow valves of an approved design. Interior pipe of thermometer well must be closed by an approved valve attached close to fitting where it passes through the tank and closed by a screw plug. Other approved arrangements that permit testing thermometer well for leaks without complete removal of the closure may be used.

§ 179.201-9 Gaging device. A gaging device of an approved design must be applied to permit determining the liquid level of the lading. The gaging device must be made of materials not subject to rapid deterioration by the lading. When the interior pipe of the gaging device provides a means for passage of the lading from the interior to the exterior of the tank, it must be equipped with an excess flow valve of an approved design. If the opening for passage of lading through the gaging device is not more than 0.060 inch diameter an excess flow valve is not required. The gaging device must be provided with a protective housing.

§ 179.201-10 Water capacity marking. (a) Water capacity of the tank in pounds stamped plainly and permanently in letters and figures at least ⅜ inch high into the metal of the tank immediately below the stamped marks specified in §179.200-24(a). This mark shall also be stenciled on the jacket immediately below the dome platform and directly behind or within 3 feet of the right or left side of the ladder, or ladders, if there is a ladder on each side of the tank, in letters and figures at least 1½ inches high as follows:

WATER CAPACITY
000000 Pounds

§ 179.201-11 Insulation. (a) Insulation shall be of sufficient thickness so that the thermal conductance at 60° F. is not more than 0.075 Btu. per hour, per square foot, per degree F. temperature differential.

§ 179.202 Special commodity requirements for non-pressure tank car tanks. (a) In addition to §§179.200 and 179.201 the following requirements are applicable:

§ 179.202-1 Flammable liquids not specifically provided for. Tank cars used to transport flammable liquids not specifically provided for must have manway closures so designed that pressure will be released automatically by starting the operation of removing the manway cover.

§ 179.202-2 Dimethyl dichlorosilane, ethyl dichlorosilane, ethyl trichlorosilane, methyl trichlorosilane, trimethyl chlorosilane, vinyl trichlorosilane, methyl dichlorosilane and trichlorosilane. Tank cars used to transport dimethyl dichlorosilane, ethyl dichlorosilane, ethyl trichlorosilane, methyl trichlorosilane, trimethyl chlorosilane, vinyl trichlorosilane, methyl dichlorosilane, and trichlorosilane, must not be equipped with bottom discharge outlet.

§ 179.202-3 Amyl mercaptan, Butyl mercaptan, Ethyl mercaptan, Isopropyl mercaptan, Propyl mercaptan, and Aliphatic mercaptan mixtures. Tank cars used to transport amyl mercaptan, butyl mercaptan, ethyl mercaptan, isopropyl mercaptan, propyl mercaptan, and aliphatic mercaptan mixtures must have bottom outlets effectively sealed. Bottom washout permitted.

§ 179.202-4 Potassium nitrate mixed (fused) with Sodium nitrite. Tank cars used to transport Potassium nitrate mixed (fused) with Sodium nitrite shall be specially designed, equipped and approved for this service, without bottom discharge outlet and with heavier plate thicknesses than the minimum prescribed for cars built under this specification. For spec. 103-W tank cars made of plates having the minimum prescribed thicknesses, internal reinforcement of the upper sheets of tank in the region of the dome and reinforcing plates attached to the bottom sheet of the tank which rests on bolsters is required, and these tanks shall be equipped with baffle plates. Heater pipes shall be of welded construction designed for a test pressure of 500 pounds per square inch. A one inch woven asbestos lining shall be placed between bolster stabbing and bottom of tank to prevent heat transmission. Safety vents of the frangible disc type may be used and if used the frangible discs shall be perforated with ⅛ inch hole. If safety relief valves are used, a vacuum relief valve shall be installed on the dome.

§ 179.202-5 Phosphorus, white or yellow. Tank cars used to transport phosphorus, white or yellow, must be equipped with approved dome fittings, external heater systems and with insulation at least 4 inches in thickness, except that thickness of insulation may be reduced to 2 inches over external heater coils. Bottom washout nozzle of approved design may be applied. Bottom outlet for discharge of lading prohibited.

§ 179.202-6 Cumene hydroperoxide, Diisopropylbenzine hydroperoxide and Paramenthane hydroperoxide. Tank cars used to transport cumene hydroperoxide of strength not exceeding 90 percent in a nonvolatile solvent. Paramenthane hydroperoxide of strength not exceeding 60 percent in a nonvolatile solvent and diisopropylbenzene hydroperoxide of strength not exceeding 60 percent in a nonvolatile solvent, must have bottom outlets effectively sealed from the inside.

§ 179.202-7 Titanium tetrachloride, anhydrous. Tank cars used to transport titanium tetrachloride, anhydrous, must be equipped with safety relief valves. Safety vents not permitted.

§ 179.202-8 Chloracetyl chloride. Tank cars used to transport chloracetyl chloride must have a nickel cladding with a minimum thickness of 1/16 inch. Nickel cladding in tanks must be low carbon nickel in accordance with ASTM B162-60. Specification DOT-103AW tank car tanks used to transport chloracetyl chloride shall be fabricated or solid nickel at least 95 percent pure and containing not more than 1 percent iron. Metal test coupons for welding procedure qualification must contain not more than 1 percent iron. All cast metal parts of the tank in contact with the lading must have a minimum nickel content of 96.7 percent.

§ 179.202-9 Hydrochloric (muriatic) acid, hydrochloric (muriatic) acid mixtures, hydrochloric (muriatic) acid solution, inhibited; sodium chlorite solution (not exceeding 42 percent sodium chlorite), and cleaning compounds, liquid, containing hydrochloric (muriatic) acid. (a) For acids not over 38 percent strength by weight, except hydrochloric (muriatic) acid of not over 22° Baume strength, tank cars may be equipped with safety vent of approved design having a frangible disc with ⅛-inch breather hole in the center, or a safety vent of approved design using carbon discs permitting continuous venting.

(b) Sodium chlorite solution. Specification DOT-103C-W tank cars having tanks of Type 304L stainless steel authorized for sodium chlorite solution not exceeding 42 percent sodium chlorite only.

§ 179.202-10 Hydrogen peroxide solution in water exceeding 52 percent by weight. Tank cars used to transport hydrogen peroxide solution in water exceeding 52 percent by weight, must be equipped with a venting arrangement approved by the Bureau of Explosives.

§ 179.202-11 Phosphorus oxybromide, Phosphorus oxychloride, Phosphorus trichloride, and Thiophosphoryl chloride. Specification DOT-103ANW tank cars used to transport phosphorus oxybromide, phosphorus oxychloride, phosphorus trichloride, and thiophosphoryl chloride, shall be fabricated of solid nickel at least 95 percent pure and containing not more than 1 percent iron. Metal test coupon for welding procedure qualification must contain not more than 1 percent iron. All cast metal parts of the tank in contact with the lading must have a minimum nickel content of approximately 96.7 percent. Specification 103A tank cars used to transport phosphorus oxybromide, phosphorus oxychloride, thiophosphoryl chloride must be lead-lined steel, or made of steel with a nickel cladding of at least 10 percent of the shell thickness. Specifications DOT-103AW, 111A100F2, or 111A60W2 tank cars used to transport phosphorus oxybromide, phosphorus oxychloride, thiophosphoryl chloride must be lead-lined steel or made of steel with a minimum thickness of nickel cladding of 1/8-inch. Nickel cladding must be low carbon nickel in accordance with ASTM B162-80. Specification 103EW tank cars used to transport phosphorus trichloride and thiophosphoryl chloride must have tanks fabricated from Type 316 stainless steel. Unlined Specification 103A, 103AW, 111A100F2, or 111A100W2 tank cars are authorized for phosphorus trichloride only.

§ 179.202-12 Sulfuric acid of concentrations 65.25 percent (approximately 1.559 specific gravity) (52° Baume) or greater. (a) Specifications DOT-103A, 103A-W, 111A100F2 or 111A100W2 tank cars used for this service may be equipped with safety vent of approved design having a frangible disc with 1/8-inch breather hole in the center.

(b) Specifications DOT-103A, 103A-W, 111A100F2 or 111A100W2 tank cars used in oleum and other fuming acids must be equipped with safety vent of approved design. Breather hole in frangible disc prohibited. Safety valve prohibited.

§ 179.202-13 Sulfur trioxide, stabilized. Tank cars used to transport sulfur trioxide, stabilized must be equipped with safety relief valves of approved design. Tanks equipped with interior heating coils are not permitted. Specification 103AW tank cars may be equipped with standpipe electrical heaters approved by the AAR Committee on Tank Cars.

§ 179.202-14 Anhydrous hydrazine and Hydrazine solution containing 50 percent or less of water. (a) Tank cars used to transport Anhydrous hydrazine or Hydrazine solutions containing 50 percent or less water, must have tanks fabricated of Type 304L stainless steel with molybdenum content not exceeding one-half of 1 percent. Specification DOT-111A100W6 tanks must not be equipped with bottom outlet.

(b) Safety relief valves for specification DOT-103C-W tank cars may have a start-to-discharge pressure of 45 p.s.i. with a tolerance of plus or minus 3 p.s.i. and a vapor tight pressure of 36 p.s.i. Refer to AAR Specifications for Tank Cars, Appendix A, A8.05.

(c) Specification 103A-ALW tank cars authorized for transporting Anhydrous hydrazine only, may have tanks equipped with a safety relief valve having start-to-discharge pressure of not more than 45 p.s.i. with a tolerance of plus or minus 3 p.s.i. and a vapor tight pressure of 36 p.s.i. Refer to AAR Specifications for Tank Cars, Appendix A, A8.05.

§ 179.202-15 Formic acid and Formic acid solutions. If a specification DOT-103EW tank car tank is used, it must be fabricated from Type 316 stainless steel.

§ 179.202-16 Monochloroacetic acid, liquid. (a) Tank cars used to transport chloroacetic acid, liquid, must have tanks with nickel cladding of at least 20 percent of the shell thickness. Nickel cladding in tanks must be low carbon nickel in accordance with ASTM B162-80.

(b) Chloroacetic acid, anhydrous, when shipped as a liquid, shall be shipped in Specification 103ANW tank car tanks fabricated of nickel containing not more than 1 percent iron, or in Specification 103AW or 111A60W2 tank car tanks with nickel cladding of at least 20 percent of the shell thickness, or be provided with a suitable corrosion resistant coating or lining. Metal test coupons for welding procedure qualification must contain not more than 1 percent iron. Nickel cladding in tanks must be low carbon nickel in accordance with ASTM B162-80.

§ 179.202-17 Benzyl chloride. Specification DOT-103ANW tank cars used to transport Benzyl chloride must have all cast metal parts in contact with the lading made from metal having a minimum nickel content of 96.7 percent.

§ 179.202-18 Ethylene oxide. (a) Each tank car used to transport ethylene oxide must be constructed to be in compliance with the following special requirements:

(1) The tank must be constructed in accordance with the DOT-111A100W4 specification.

(2) The safety relief valve, if not located on the manway nozzle, must be protected by an approved and insulated protective housing. Each safety relief valve must have its discharge piped to the top of the manway bonnet assembly or protective housing. Vapor exit from the manway bonnet assembly or protective housing must be provided through a full opening weather cap located directly above the safety valve vent pipe. Compliance with this provision is required after January 31, 1975, except that tank cars which are not in compliance and were built before January 31, 1975, must be in compliance by July 31, 1976.

(3) Copper, silver, mercury, magnesium, or their alloys may not be used in any part of the tank or appurtenances if that part or appurtenance is normally in contact with ethylene oxide liquid or vapor.

(4) Interior pipes of liquid discharge valves, vapor lines, gaging devices (when the device provides a means for passage of the lading from the interior to the exterior of the tank) and sampling lines must be equipped with excess flow valves of an approved design.

(5) Each tank must be equipped with a thermometer well.

(6) Each tank must be insulated with glass fiber except tank cars built before January 31, 1975, are authorized in this service when insulated with cork.

(7) Manway nozzle, cover plate, and protective housing must be of approved design. The manway protective housing and cover must be insulated with glass fiber or other material that will provide protection against heat deterioration of the valves and any resilient material contained within the housing. Compliance with this provision is mandatory after January 31, 1975, except that tank cars which are in compliance and were built before January 31, 1975, must be in compliance by July 31, 1976.

(8) Neoprene, natural rubber, and asbestos gaskets are prohibited. All valve stem packings, O-rings, and gaskets must be constructed of materials which do not react spontaneously with or lower the autoignition temperature of ethylene oxide.

(9) Vacuum relief valves are prohibited.

(10) After December 31, 1986, each tank built with a water capacity (shell full volume, including manways) exceeding 18,500 U.S. gallons shall conform to class DOT-111J.

(11) Specification 111 tank cars built after March 1, 1984, are not authorized for the transportation of ethylene oxide.

§ 179.202-19 Dimethylhydrazine, unsymmetrical. Tank cars used to transport Dimethylhydrazine, unsymmetrical, must be equipped with steel safety valves of approved design. Specification DOT-103-W tank cars must not be equipped with bottom outlets.

§ 179.202-20 Hydrofluoric acid. Breather hole in frangible disc prohibited.

§ 179.202-21 Nitric acid. (a) Tank cars used to transport Nitric acid must comply with the following requirements:

(1) Bottom washout or bottom outlet is prohibited unless effectively sealed with an approved arrangement to prevent use during loading and unloading of acid.

(2) Safety vent is prohibited.

§ 179.202-22 Mixed acid (nitric and sulfuric acid) (nitrating acid). Specifications DOT-103A, 103AW, 111A100F1 or 111A100W2 tank cars used in nitrating and other fuming acids service must be equipped with safety vent of approved design. Breather hole in frangible disc prohibited. Safety valve prohibited.

§ 179.203 Special requirements for specification 111 tank cars.

§ 179.203-1 General.

(a) In addition to the requirements of this section, each tank car built under specification 111 shall meet the applicable requirements of §§ 179.200, 179.201, and 179.202.

(b) Notwithstanding the provisions of §§ 179.3, 179.4, and 179.6, AAR approval is not required for changes in or additions to specification 111 tank cars in order to comply with this section.

(c) Notwithstanding the provisions of § 173.8 of this subchapter, no specification 111 tank car manufactured to specifications promulgated by the Canadian Transport Commission may be used after February 28, 1985, to transport hazardous materials in the United States unless it is equipped with a coupler vertical restraint system that meets the requirements of § 179.105-6.

(d) Notwithstanding the provisions of § 173.9 of this subchapter, no specification 111 tank car manufactured to specifications promulgated by the Canadian Transport Commission and with a water capacity (shell full volume, including manways) exceeding 18,500 U.S. gallons, may be used after December 31, 1986, to transport flammable gases or ethylene oxide unless it is equipped in accordance with § 179.203-2.

(e) Specification 111 tank cars built after March 1, 1984 are not permitted for the transportation of flammable gases or ethylene oxide.

§ 179.203-2 Previously built cars.

(a) Each specification 111J tank car built before March 1, 1984, shall be equipped with:

(1) A coupler vertical restraint system that meets the requirements of § 179.105-6;

(2) A thermal protection system that meets the requirements of § 179.105-4;

(3) A safety relief valve that meets the requirements of § 179.105-7; and

(4) A tank head puncture resistance system that meets the requirements of § 179.105-5.

§ 179.203-3 Stenciling.
Each specification 111 tank car built before March 1, 1984 that is equipped as prescribed in § 179.203-2(a) shall be stenciled by having the letter "J" substituted for the letter "A" in the specification marking.

§ 179.220 General specifications applicable to nonpressure tank car tanks consisting of an inner container supported within an outer shell (class DOT-115).

§ 179.220-1 Tanks built under these specifications must meet the requirements of § 179.220, § 179.221 and § 179.222.

§ 179.220-2 Approval. For procedures in securing approval, see § 179.3.

§ 179.220-3 Type. (a) Tanks built under these specifications must consist of an inner container, a support system for the inner container, and an outer shell.
(b) The inner container must be a fusion welded tank of circular cross section with formed heads designed convex outward and must have a manway on top of the tank as prescribed herein. When the inner container is divided into compartments, each compartment must be considered a separate container.
(c) The outer shell must be a fusion welded tank with formed heads designed convex outward.

§ 179.220-4 Insulation. The annular space between the inner container and the outer shell must contain an approved insulation material.

§ 179.220-5 Bursting pressure. The minimum required bursting pressure of the inner container is listed in § 179.221-1.

§ 179.220-6 Thickness of plates. (a) The wall thickness, after forming of the inner container shell and 2:1 ellipsoidal heads must be not less than specified in § 179.221-1, or not less than that calculated by the following formula:

$$t = \frac{Pd}{2SE}$$

where:
d = Inside diameter in inches;
E = 0.9 welded joint efficiency; except E = 1.0 for seamless heads;
P = Minimum required bursting pressure in p.s.i.;
S = Minimum tensile strength of plate material in p.s.i. as prescribed in AAR Specifications for Tank Cars, Appendix M, Table M1;
t = Minimum thickness of plate in inches after forming.
(b) The wall thickness after forming of the inner container heads, if flanged and dished, must be not less than specified in § 179.221-1, or not less than that calculated by the following formula:

$$t = \frac{5PL}{6SE}$$

where:
E = 0.9 welded joint efficiency; except E = 1.0 for seamless heads;
L = Main inside radius to which head is dished, measured on concave side in inches;
P = Minimum required bursting pressure in p.s.i.;
S = Minimum tensile strength of plate material in p.s.i. as prescribed in AAR Specifications for Tank Cars, Appendix M, Table M1;
t = Minimum thickness of plate in inches after forming.
(c) The wall thickness after forming of the cylindrical section and heads of the outershell must be not less than seven-sixteenths inch.
(d) See § 179.220-9 for plate thickness requirements for inner container when divided into compartments.

§ 179.220-7 Materials. (a) The plate material used to fabricate the inner container and nozzles must meet one of the following specifications and with the indicated minimum tensile strength and elongation in the welded condition.
(b) Carbon steel plate: The maximum allowable carbon content must be 0.31 percent when the individual specification allows carbon content greater than this amount. The plates may be clad with other approved materials.

Specifications	Minimum tensile strength (p.s.i.) welded condition[1]	Minimum elongation in 2 inches (percent) weld metal (longitudinal)
ASTM A 515-70, Gr. 55	55,000	28
ASTM A 515-70, Gr. 60	60,000	25
ASTM A 515-70, Gr. 65	65,000	20
ASTM A 515-70, Gr. 70	70,000	20
ASTM A 285-70a, Gr. A	45,000	29
ASTM A 285-70a, Gr. B	50,000	20

AAR TC128-70, Gr. A and B	81,000	19

[1] Maximum stresses to be used in calculations.

(c) Aluminum alloy plate: Aluminum alloy plate must be suitable for welding and comply with one of the following specifications:

Specifications	Minimum tensile strength (p.s.i.) welded condition[1][2]	Minimum elongation in 2 inches (percent) weld metal (longitudinal)
ASTM B 209-70, Alloy 5052[3]	25,000	18
ASTM B 209-70, Alloy 5083[3]	38,000	16
ASTM B 209-70, Alloy 5086[3]	35,000	14
ASTM B 209-70, Alloy 5154[3]	30,000	18
ASTM B 209-70, Alloy 5254[3]	30,000	18
ASTM B 209-70, Alloy 5454[3]	31,000	18
ASTM B 209-70, Alloy 5652[3]	25,000	18
ASTM B 209-70, Alloy 6061[4]	24,000[5]	5[5]

[1] For fabrication, the parent plate material may be 0, H112, or H32 temper, but design calculations must be based on minimum tensile strength shown.
[2] 0 temper only.
[3] Weld filler metal 5556 must not be used.
[4] Not authorized for tank shells, manways or domes.
[5] T6 temper only.
[6] Maximum stress to be used in calculations.

(d) High alloy steel plate: High alloy steel plate must comply with one of the following specifications:

Specifications	Minimum tensile strength (p.s.i.) welded condition[1]	Minimum elongation in 2 inches (percent) weld metal (longitudinal)
ASTM A240-70, Type 304	75,000	30
ASTM A240-70, Type 304L	70,000	30
ASTM A240-70, Type 316	75,000	30
ASTM A240-70, Type 316L	70,000	30

[1] Maximum stresses to be used in calculations.

(e) Manganese-molybdenum steel plate: Manganese-molybdenum steel plate must be suitable for fusion welding and must comply with the following specification:

Specifications	Minimum tensile strength (p.s.i.) welded condition[1]	Minimum elongation in 2 inches (percent) weld metal (longitudinal)
ASTM A302-70a, Gr. B	80,000	20

[1] Maximum stresses to be used in calculations.

(f) Plate materials used to fabricate the outer shell and heads must be those listed in paragraphs (b), (c), (d), or (e) of this section. The maximum allowable carbon content must be 0.31 percent when the individual specification allows carbon content greater than this amount. The plates may be clad with other approved materials.
(g) All appurtenances on the inner container in contact with the lading must be made of approved material compatible with the plate material of the inner container. These appurtenances must not be subject to rapid deterioration by the lading, or must be coated or lined with suitable corrosion resistant material. See AAR Specifications for Tank Cars, Appendix M, M4.05 for approved material specifications for castings for fittings.

§ 179.220-8 Tank heads. (a) Tank heads of the inner container, inner container compartments and outer shell must be of approved contour, and may be flanged and dished or ellipsoidal for pressure on concave side.
(b) Flanged and dished heads must have main inside radius not exceeding 10 feet and inside knuckle radius must be not less than 3¾ inches for steel and alloy steel tanks nor less than 5 inches for aluminum alloy tanks.
(c) Ellipsoidal heads must be ellipsoid of revolution in which the major axis must equal the diameter of the shell and the minor axis must be one-half the major axis.

§ 179.220-9 Compartment tanks. (a) The inner container may be divided into compartments by inserting interior heads, or by fabricating each compartment as a separate container and joining with a cylinder, or by fabricating each compartment as a separate tank without a joining cylinder. Each compartment must be capable of withstanding, without evidence of yielding or leakage, the required test pressure applied in each compartment separately, or in any combination of compartments.
(b) When the inner container is divided into compartments by fabricating each compartment as a separate container and joining with a cylinder, the cylinder must have a plate thickness not less than that required for the inner container shell and must be applied to the outside surface of the straight flange portion of the container head. The cylinder must fit the straight flange tightly for a distance of at least two times the plate thickness, or 1 inch, whichever is greater and must be joined to the straight flange by a full fillet weld. Distance from fillet weld seam to container head seam must be not less than 1½ inches or three times the plate thickness, whichever is greater.

For explanation of abbreviations and reference marks, see last page of this tariff.

§ 179.220-10 Welding. (a) All joints must be fusion-welded in compliance with AAR Specifications for Tank Cars, Appendix W. Welding procedures, welders, and fabricators shall be approved.

(b) Radioscopy of the outer shell is not a specification requirement.

(c) Welding is not permitted on or to ductile iron or malleable iron fittings.

§ 179.220-11 Postweld heat treatment. (a) Postweld heat treatment of the inner container is not a specification requirement.

(b) Postweld heat treatment of the cylindrical portions of the outer shell to which the anchorage or draft sills are attached must comply with AAR Specifications for Tank Cars, Appendix W.

(c) When cold formed heads are used on the outer shell they must be heat treated before welding to shell if postweld heat treatment is not practicable due to assembly procedures.

§ 179.220-12 Tank mounting. See § 179.10

§ 179.220-13 Inner container manway nozzle and cover. (a) Inner container manway nozzle must be of approved design with access opening at least 18 inches inside diameter, or at least 14 inches by 18 inches obround or oval.

(b) Manway covers must be of approved type. Design must provide a secure closure of the manway and must make it impossible to remove the cover while the tank interior is under pressure.

(c) All joints between manway covers and their seats must be made tight against leakage of vapor and liquid by use of suitable gaskets.

(d) Manway covers must be cast, forged, or fabricated metal complying with subsection § 179.220-7(g) of this section.

(e) A seal must be provided between the inner container manway nozzle and the opening in the outer shell.

§ 179.220-14 Openings in the tanks. Openings in the inner container and the outer shell must be reinforced in compliance with AAR Specifications for Tank Cars, Appendix E. In determining the required reinforcement area for openings in the outer shell, *t* shall be one-fourth inch.

§ 179.220-15 Support system for inner container. (a) The inner container must be supported within the outer shell by a support system of adequate strength and ductility at its operating temperature to support the inner container when filled with liquid lading to any level. The support system must be designed to support, without yielding, impact loads producing accelerations of the following magnitudes and directions when the inner container is loaded so that the car is at its rail load limit, and the car is equipped with a conventional AAR Specification M-901 draft gear.

Longitudinal	7G
Transverse	3G
Vertical	3G

(b) The longitudinal acceleration may be reduced to 3G where a cushioning device of approved design, which has been tested to demonstrate its ability to limit body forces of 400,000 pounds maximum at a 10 miles per hour impact, is used between the coupler and the tank structure. The support system must be of approved design and the inner container must be thermally isolated from the outer shell to the best practical extent. The inner container and outer shell must be permanently bonded to each other electrically either by the support system used, piping, or by a separate electrical connection of approved design.

§ 179.220-16 Expansion capacity. Expansion capacity must be provided in the shell of the inner container as prescribed in § 179.221-1.

§ 179.220-17 Gaging devices, top loading and unloading devices, venting and air inlet devices. (a) When installed, each device must be of approved design which will prevent interchange with any other fixture and must be tightly closed. Each unloading pipe must be securely anchored within the inner container. Each inner container or compartment thereof may be equipped with one separate air connection.

(b) When the characteristics of the commodity for which the car is authorized require these devices to be equipped with valves or fittings to permit the loading and unloading of the contents, these devices including valves, shall be provided with a protective housing except when plug or ball-type valves with operating handles removed are used. Provision must be made for closing pipe connections of valves.

(c) Inner container may be equipped with a vacuum relief valve of approved design. Protective housing is not required.

(d) When a gaging device is required in § 179.221-1, an outage scale visible through the manway opening and must be provided. If loading devices are applied permit tank loading with cover closed, a tell tale pipe may be provided. The telltale pipe must be capable of determining that required outage is provided. The pipe must be equipped with ¼-inch maximum, NPT control valve mounted outside tank and enclosed within a protective housing. Other approved devices may be used in place of an outage scale or a telltale pipe.

(e) The bottom of the tank shell may be equipped with a sump or siphon bowl, or both, welded or pressed into the shell. These sumps or siphon bowls, if applied, are not limited in size and must be made of cast, forged, or fabricated metal. Each sump or siphon bowl must be of good welding quality in conjunction with the metal of the tank shell. When the sump or siphon bowl is pressed in the bottom of the tank shell, the wall thickness of the pressed section must not be less than that specified for the shell. The section of a circular cross section tank to which a sump or siphon bowl is attached need not comply with the out of roundness requirement specified in Appendix W, W14.06 of the AAR Specifications for Tank Cars. Any portion of a sump or siphon bowl not forming a part of a cylinder of revolution must have walls of such thickness and must be so reinforced that the stresses in the walls caused by a given internal pressure are not greater than the circumferential stress which would exist under the same internal pressure in the wall of a tank of circular cross section designed in accordance with §§ 179.220-6(a) and 179.220-9. In no case shall the wall thickness be less than that specified in § 179.221-1(a).

(f) Protective housing, when required, must be of approved material and must have cover and sidewalls not less than 0.119 inch in thickness.

§ 179.220-18 Bottom outlets. (a) The inner container may be equipped with a bottom outlet of approved design and an opening provided in the outer shell for its access. If applied, the bottom outlet must comply with the following requirements:

(1) The extreme projection of the bottom outlet equipment may not be more than that allowed by Appendix E of the AAR Specifications for Tank Cars. All bottom outlet reducers and closures and their attachments shall be secured to car by at least ⅜-inch chain, or its equivalent, except that bottom outlet closure plugs may be attached by ¼-inch chain. When the bottom outlet closure is of the combination cap and valve type, the pipe connection to the valve shall be closed by a plug, or cap. The bottom outlet equipment should include only the valve, reducers and closures that are necessary for the attachment of unloading fixtures. The permanent attachment of supplementary exterior fittings shall be approved by the AAR Committee on Tank Cars.

(2) Each bottom outlet must be provided with a liquid tight closure at its lower end.

(3) The valve and its operating mechanism must be applied to the outside bottom of the inner container. The valve operating mechanism must be provided with a suitable locking arrangement to insure positive closure during transportation.

(4) Valve outlet nozzle and valve body must be of cast, fabricated or forged metal. If welded to inner container, they must be of good weldable quality in conjunction with metal of tank.

(5) To provide for the attachment of unloading connections, the bottom of the main portion of the outlet nozzle or valve body, or some fixed attachment thereto, must be provided with threaded cap closure arrangement or bolted flange closure arrangement having minimum 1-inch threaded pipe plug.

(6) If outlet nozzle and its closure extends below the bottom of the outer shell, a V-shaped breakage groove shall be cut (not cast) in the upper part of the outlet nozzle at a point immediately below the lowest part of the valve closest to the tank. In no case may the nozzle wall thickness at the root of the "V" be more than ¼-inch. The outlet nozzle or the valve body may be steam jacketed, in which case the breakage groove or its equivalent must be below the steam chamber but above the bottom of the center sill construction. If the outlet nozzle is not a single piece or its exterior valves are applied, provision shall be made for the equivalent of the breakage groove. On cars without continuous center sills, the breakage groove or its equivalent may not be more than 15 inches below the outer shell. On cars with continuous center sills, the breakage groove or its equivalent must be above the bottom of the center sill construction.

(7) The valve body must be of a thickness which will prevent distortion of the valve seat or valve by any change in contour of the shell resulting from expansion of lading, or other causes, and which will insure that accidental breakage of the outlet nozzle will occur at or below the "V" groove, or its equivalent.

(8) The valve must have no wings or stem projection below the "V" groove or its equivalent. The valve and seat must be readily accessible or removable for repairs, including grinding.

(b) Inner container may be equipped with bottom washout of approved design. If applied, bottom washout must comply the following requirements:

(1) The extreme projection of the bottom washout equipment may not be more than that allowed by Appendix E of the AAR Specifications for Tank Cars.

(2) Bottom washout must be of cast, forged or fabricated metals. If it is welded to the inner container, it must be of good weldable quality in conjunction with metal of tank.

(3) If washout nozzle extends below the bottom of the outer shell, a V-shaped breakage groove shall be cut (not cast) in the upper part of the nozzle at a point immediately below the lowest part of the inside closure seat or plug. In no case may the nozzle wall thickness at the root of the "V" be more than ¼-inch. Where the nozzle is not a single piece, provisions shall be made for the equivalent of the breakage groove. The nozzle must be of a thickness to insure that accidental breakage will occur at or below the "V" groove or its equivalent. On cars without a continuous center sill, the breakage groove or its equivalent may not be more than 15 inches below the outer shell. On cars with continuous center sills, the breakage groove or its equivalent must be above the bottom of the center sill construction.

(4) The closure plug and seat must be readily accessible or removable for repairs.

(5) The closure of the washout nozzle must be equipped with a ¼-inch solid screw plug. Plug must be attached by at least a ¼-inch chain.

(6) Joints between closures and their seats may be gasketed with suitable material.

§ 179.220-19 Safety relief devices. (a) Each inner container or compartment must be equipped with safety relief devices of approved design as prescribed in § 179.221-1.

(b) When used, each safety relief valve must be made of metal not subject to rapid deterioration by the lading, and mounted on the top of the inner container. Total valve discharge capacity must be sufficient to prevent building up of pressure in the inner container to more than 10 p.s.i. above the start-to-discharge pressure. See AAR Specifications for Tank Cars, Appendix A, for formula for calculating discharge capacity. The start-to-discharge pressures and vapor tight pressures must comply with § 179.221-1.

(c) Each inner container or compartment used for the transportation of a corrosive liquid, a flammable solid, an oxidizing material, or a poisonous liquid or solid Class B, need not be equipped with a safety relief valve, but if not so equipped, it must have one safety vent at least 1 ¼ inches in inside diameter made of material not subject to rapid deterioration by the lading. Each safety vent must be mounted on the top of the inner container. This vent must be of an approved design which will prevent interchange with fixtures prescribed in § 179.220-17. It must be closed with a frangible disc of lead or other approved material. Vent bursting pressure must comply with § 179.221-1. Except for tanks for chloroprene (see § 179.222-1), tanks equipped with vents shall be stenciled "Not for flammable liquids".

§ 179.220-20 Reinforcements, when used, and appurtenances not otherwise specified. All attachments to inner container and outer shell must be applied by approved means.

§ 179.220-21 Interior heating system. For heater system inside of inner container see § 179.12.

§ 179.220-22 Closure for openings. (a) All plugs must be solid, with NPT threads, and must be of a length which will screw at least six threads inside the face of fitting or tank. Plugs, when inserted from the outside of the outer shell tank heads, must have the letter "S" at least three-eighths inch in size stamped with steel stamp or cast on the outside surface to indicate the plug is solid.

(b) Openings in the outer shell used during construction for installation must be closed in an approved manner.

§ 179.220-23 Test of tanks. (a) Each inner container or compartment must be tested hydrostatically to the pressure specified in § 179.221-1. The temperature of the pressurizing medium must not exceed 100° F. during the test. The container must hold the prescribed pressure for at least 10 minutes without leakage or evidence of distress. Safety relief devices must not be in place when the test is made.

(b) The inner container must be pressure tested before installation within the outer shell. Items which, because of assembly sequence, must be welded to inner container after its installation within outer shell must have their attachment welds thoroughly inspected by a non-destructive dye penetrant method or its equivalent.

(c) Pressure testing of outer shell is not a specification requirement.

§ 179.220-24 Tests of safety relief valves. Each safety relief valve must be tested by air or gas for compliance with § 179.221-1 before being put into service.

§ 179.220-25 Stamping. To certify that the tank complies with all specification requirements, each outer shell must be plainly and permanently stamped in letters and figures at least ⅛-inch high into the metal near the center of both outside heads as follows:

	Example of required stamping
Specifications	DOT-115A60W8
Inner container.	
Material	ASTM A240-316L
Shell thickness	Shell 0.187 in.
Head thickness	Head 0.150 in.
Tank builders initials	ABC
Date of original test	00-0000
Outer shell.	
Material	ASTM A285 C
Tank builders initials	WYZ
Car assembler (if other than inner container or outer shell builders)	DEF

§ 179.220-26 Stenciling. (a) The outer shell, or the jacket if the outer shell is insulated, must be stenciled in compliance with AAR Specifications for Tank Cars, Appendix C.

(b) Stenciling must be applied on both sides of the outer shell or jacket near the center in letters and figures at least 1½ inches high to indicate the safe upper temperature limit, if applicable, for the inner tank, insulation, and support system.

§ 179.220-27 Certificate of construction. See § 179.5.

§ 179.221 Individual specification requirements applicable to tank car tanks consisting of an inner container supported within an outer shell.

§ 179.221-1 Individual specification requirements. In addition to § 179.220, the individual specification requirements for the inner container are as follows:

Specifications	115A60W1	115A60AL/W	115A60W8
Inner container material (see § 179.220-7)	Steel	Al. Alloy	Alloy steel
Bursting pressure, p.s.i. (see § 179.220-5)	240	240	240
Minimum plate thickness, shell and heads, inches (see § 179.220-6)	⅛	3/16	⅛
Minimum expansion capacity (see § 179.220-16)	2 percent in tank	2 percent in tank	2 percent in tank
Test pressure, p.s.i. (see § 179.220-23)	60	60	60
Safety relief device (see § 179.220-19)	Valve or vent	Valve or vent	Valve or vent
Valve start-to-discharge pressure, p.s.i. (±3 p.s.i.)	35	35	35
Valve vapor tight pressure (minimum, p.s.i.)	28	28	28
Valve flow rating pressure (maximum, p.s.i.)	45	45	45
Vent rupture pressure (maximum, p.s.i.)	45	45	45
Gaging devices (see § 179.220-17)	Required	Required	Required
Top loading and unloading devices (see § 179.220-17)	Optional	Optional	Optional
Special reference	§ 179.222-1		§ 179.222-1

§ 179.222 Special commodity requirements for DOT 115A tank car tanks. In addition to § 179.220 and § 179.221 the following requirements are applicable.

§ 179.222-1 Chloroprene. DOT 115A tank car tanks used to transport chloroprene shall be equipped with a safety vent of a diameter not less than 12 inches complying with § 179.221-1 instead of a safety relief valve. The outer shell shall be stenciled "CHLOROPRENE" on both sides in letters not less than four inches high.

SUBPART E

SPECIFICATIONS FOR MULTI-UNIT TANK CAR TANKS

(Classes DOT 106A and 110AW)

§ 179.300 General specifications applicable to multiunit tank car tanks designed to be removed from car structure for filling and emptying (Classes DOT-106A and 110A-W).

§ 179.300-1 Tanks built under these specifications shall meet the requirements of § 179.300, § 179.301 and when applicable, § 179.302.

§ 179.300-2 Approval. (a) For procedure for securing approval, see § 179.3.

§ 179.300-3 Type and general requirements. (a) Tanks built under this specification shall be cylindrical, circular in cross section, and shall have heads of approved design. All openings shall be located in the heads.

(b) Each tank shall have a water capacity of at least 1500 pounds and not more than 2600 pounds.

(c) For tanks made in foreign countries, a chemical analysis of materials and all tests as specified shall be carried out within the limits of the United States under the supervision of a competent and impartial inspector.

§ 179.300-4 Insulation. (a) Tanks shall not be insulated.

§ 179.300-5 Bursting pressure. (a) The minimum required bursting pressure is listed in § 179.301.

§ 179.300-6 Thickness of plates. (a) For class DOT-110A tanks the wall thickness after forming of the cylindrical portion of the tank

must not be less than that specified in § 179.301 nor that calculated by the following formula:

$$t = \frac{Pd}{2SE}$$

where:
d = inside diameter in inches;
E = 1.0 welded joint efficiency;
P = minimum required bursting pressure in psi;
S = minimum tensile strength of plate material in psi, as prescribed in § 179.300-7;
t = minimum thickness of plate material in inches after forming.

(b) For Class DOT-106A tanks, the wall thickness of the cylindrical portion of the tank shall not be less than that specified in § 179.301 and shall be such that at the tank test pressure the maximum fiber stress in the wall of the tank will not exceed 15,750 psi, as calculated by the following formula:

$$s = \frac{p(1.3D^2 + 0.4d2)}{D^2 - d^2}$$

where:
d = inside diameter in inches;
D = outside diameter in inches;
p = tank test pressure in psi;
s = wall stress in psi.

(c) If plates are clad with material having tensile strength at least equal to the base plate, the cladding may be considered a part of the base plate when determining the thickness. If cladding material does not have tensile strength at least equal to the base plate, the base plate alone shall meet the thickness requirements.

§ 179.300-7 Materials. (a) Carbon steel plate material used to fabricate tanks having heads fusion welded to tank shell must comply with the following specifications with the indicated minimum tensile strength and elongation in the welded condition. The maximum allowable carbon content must be 0.31 percent when the individual specification allows carbon content greater than this amount. The plates may be clad with other approved materials.

Specifications	Minimum tensile strength (psi) welded condition[1]	Minimum elongation in 2 inches (percent) welded condition (longitudinal)
ASTM A 285-69 Gr. A	45,000	29
ASTM A 285-69 Gr. B	50,000	20
ASTM A 285-69 Gr. C	55,000	20
ASTM A 515-69 Gr. 65	65,000	20
ASTM A 515-69 Gr. 70	70,000	20

[1] Maximum stresses to be used in calculations.

(b) Carbon steel plate material used to fabricate tanks with forge welded heads must comply with the following specifications:

Specifications	Minimum tensile strength (psi) welded condition[1]	Minimum elongation in 2 inches (percent) welded condition (longitudinal)
ASTM A 285-69 Gr. A	45,000	29

[1] Maximum stresses to be used in calculations.

(c) All plates must have their heat number and the name or brand of the manufacturer legibly stamped on them at the rolling mill.

§ 179.300-8 Tank heads. (a) Class DOT-110A tanks shall have fusion-welded heads formed concave to pressure. Heads for fusion welding shall be an ellipsoid of revolution 2:1 ratio of major to minor axis. They shall be one piece, hot formed in one heat so as to provide a straight flange at least 1½ inches long. The thickness shall not be less than that calculated by the following formula:

$$t = \frac{Pd}{2SE}$$

where symbols are as defined in § 179.300-6(a).

(b) Class DOT-106A tanks must have forged-welded heads, formed convex to pressure. Heads for forge welding must be torispherical with an inside radius not greater than the inside diameter of the shell. They must be one piece, hot formed in one heat so as to provide a straight flange at least 4 inches long. They must have snug drive fit into the shell for forge welding. The wall thickness after forming must be sufficient to meet the test requirements of § 179.300-16 and to provide for adequate threading of openings.

§ 179.300-9 Welding. (a) Longitudinal joints must be fusion welded. Head-to-shell joints must be forge welded on class DOT-106A tanks and fusion welded on class DOT-110A tanks. Welding procedures, welders and fabricators must be approved in accordance with AAR Specifications for Tank Cars, Appendix W.

(b) Fusion-welded joints must be in compliance with the requirements of AAR Specifications for Tank Cars, Appendix W, except that circumferential welds in tanks less than 36 inches inside diameter need not be radiotaped.

(c) Forge-welded joints shall be thoroughly hammered or rolled to insure sound welds. The flanges of the heads shall be forge lapwelded to the shell and then crimped inwardly toward the center line at least one inch on the radius. Welding and crimping must be accomplished in one heat.

§ 179.300-10 Postweld heat treatment. After welding is complete, steel tanks and all attachments welded thereto, must be postweld heat treated as a unit in compliance with the requirements of AAR Specifications for Tank Cars, Appendix W.

§ 179.300-11 Tank mounting. (a) For tank mounting, see § 179.10.

§ 179.300-12 Protection of fittings. (a) Tanks shall be of such design as will afford maximum protection to any fittings or attachment to the head including the housing referred to in § 179.300-12(b). Tank ends shall slope or curve inward toward the axis so that the diameter at each end is at least 2 inches less than the maximum diameter.

(b) Loading and unloading valves shall be protected by a detachable protective housing of approved design which shall not project beyond the end of the tank and shall be securely fastened to the tank head. Safety relief devices shall not be covered by the housing.

§ 179.300-13 Venting, loading and unloading valves. (a) Valves shall be of approved type, made of metal not subject to rapid deterioration by lading, and shall withstand tank test pressure without leakage. The valves shall be screwed directly into or attached by other approved methods to one tank head. Provision shall be made for closing outlet connections of the valves.

(b) Threads for openings shall be National Gas Taper Threads (NGT) tapped to gage, clean cut, even and without checks.

§ 179.300-14 Attachments not otherwise specified. Siphon pipes and their couplings on the inside of the tank head and lugs on the outside of the tank head for attaching the valves protective housing must be fusion-welded in place prior to postweld heat treatment. All other fixtures and appurtenances, except as specifically provided for, are prohibited.

§ 179.300-15 Safety relief devices. (a) Unless prohibited in § 179.302, or in Part 173, tanks shall be equipped with one or more safety relief devices of approved type, made of metal not subject to rapid deterioration by the lading and screwed directly into tank heads or attached to tank heads by other approved methods. The total discharge capacity shall be sufficient to prevent building up pressure in tank in excess of 82.5 percent of the tank test pressure. When safety relief devices of the fusible plug type are used, the required discharge capacity shall be available in each head. See AAR Specifications for Tank Cars, Appendix A, for formula for calculating discharge capacity.

(b) Threads for openings shall be National Gas Taper Thread (NGT) tapped to gage, clean cut, even and without checks.

(c) Safety relief valves shall be set for start-to-discharge and frangible discs shall burst at a pressure not exceeding that specified in § 179.301.

(d) Fusible plugs shall function at a temperature not exceeding 175° F. and shall be vapor-tight at a temperature of not less than 130° F.

§ 179.300-16 Tests of tanks. (a) After stress relieving, tanks shall be subjected to hydrostatic expansion test in a water jacket, or by other approved methods. No tank shall have been subjected previously to internal pressure within 100 pounds of the test pressure. Each tank shall be tested to the pressure prescribed in § 179.301. Pressure shall be maintained for 30 seconds and sufficiently longer to insure complete expansion of tank. Pressure gage shall permit reading to accuracy of one percent. Expansion gage shall permit reading of total expansion to accuracy of one percent. Expansion shall be recorded in cubic centimeters.

(1) No leaks shall appear and permanent volumetric expansion shall not exceed 10 percent of total volumetric expansion at test pressure.

(b) After all fittings have been installed, each tank shall be subjected to interior air pressure test of at least 100 psi, under conditions favorable to detection of any leakage. No leaks shall appear.

(c) Repairs of leaks detected in manufacture or in foregoing tests shall be made by the same process as employed in manufacture of tank. Caulking, soldering, or similar repairing is prohibited.

§ 179.300-17 Tests of safety relief devices. (a) Each valve shall be tested by air or gas before being put into service. The valve shall open and be vapor-tight at the pressures prescribed in § 179.301.

(b) Frangible discs of safety vents must be tested as prescribed in AAR Specifications for Tank Cars, Appendix A, A5.03.

(c) For safety relief devices of the fusible plug type, a sample of the plug used shall function at the temperatures prescribed in § 179.300-15.

(d) The start-to-discharge and vapor-tight pressures shall not be affected by any auxiliary closure or other combination.

§ 179.300-18 Stamping. (a) To certify that the tank complies with all specification requirements, each tank shall be plainly and permanently stamped in letters and figures ⅜ inch high into the metal of valve end chime as follows:

(1) DOT Specification number.

(2) Material and cladding material if any (immediately below the specification number).

(3) Owner's or builder's identifying symbol and serial number (immediately below the material identification). The symbol shall be registered with the Bureau of Explosives, duplications are not authorized.

(4) Inspector's official mark (immediately below the owner's or builder's symbol).

(5) Date of original tank test (month and year, such as 1-64 for January 1964). This should be so placed that dates of subsequent tests may easily be added thereto.

(6) Water capacity—0000 pounds.

(b) A copy of the above stamping in letters and figures of the prescribed size stamped on a brass plate secured to one of the tank heads is authorized.

§ 179.300-19 Inspection. (a) Tank shall be inspected within the United States and Canada by a competent and impartial inspector acceptable to the Bureau of Explosives. For tanks made outside the United States and Canada, the specified inspection shall be made within the United States.

(b) The inspector shall carefully inspect all plates from which tanks are to be made and secure records certifying that plates comply with the specification. Plates which do not comply with § 179.300-7 shall be rejected.

(c) The inspector shall make such inspection as may be necessary to see that all the requirements of this specification, including markings, are fully complied with; shall see that the finished tanks are properly stress relieved and tested.

(d) The inspector shall stamp his official mark on each accepted tank as required in § 179.300-18, and render the report required in § 179.300-20.

§ 179.300-20 Reports. (a) Before a tank is placed in service, the inspector shall furnish to the builder, tank owner, Bureau of Explosives and the Secretary, Mechanical Division, Association of American Railroads, a report in approved form certifying that the tank and its equipment comply with all the requirements of this specification.

(b) For builder's Certificate of Construction, see § 179.5(b), (c), and (d).

§ 179.301 Individual specification requirements for multi-unit tank car tanks. (a) In addition to § 179.300 the individual specification requirements are as follows:

DOT Specifications	106A500X	106A800X	110A500W	110A600W	110A800W	110A1000W
Bursting pressure psi (see § 179.300-5)	(1)	(1)	1250	1500	2000	2500
Minimum thickness shell, inches	13/32	11/16	11/32	3/8	15/32	19/32
Test pressure psi (see § 179.300-16)	500	800	500	600	800	1000
Safety relief devices psi (see § 179.300-15)	......	......	......	......	......	......
Start-to-discharge or burst maximum psi	375	600	375	450	600	750
Vapor tight minimum psi	300	480	300	360	480	600

[1] None specified

§ 179.302 Special commodity requirements for multi-unit tank car tanks. (a) In addition to §§ 179.300 and 179.301, the following requirements are applicable:

Commodity	Safety relief device	Valve protective housing	Miscellaneous
Chlorine trifluoride	Prohibited[1]		
Chlorpicrin	Prohibited[1]	Gas tight[2]	
Hydrofluoric acid	Prohibited[1]	Gas tight[2]	
Hydrogen sulfide	Fusible plugs required[7]	Required[6]	(3)
Methyl mercaptan	Prohibited[1]		
Nitric oxide	Prohibited[1]	Gas tight[2]	
Nitrogen dioxide liquid	Prohibited[1]	Gas tight[2]	
Nitrogen peroxide liquid	Prohibited[1]	Gas tight[2]	
Nitrogen tetroxide liquid	Prohibited[1]	Gas tight[2]	
Nitrogen tetroxide-nitric oxide mixtures	Prohibited[1]	Gas tight[2]	
Nitrosyl chloride	Fusible plugs required		(4)
Phosgene	Prohibited[1]	Gas tight[2]	
Titanium tetrachloride (anhydrous)	Prohibited[1]		
Vinyl chloride			(5)
Vinyl methyl ether			(5)

[1] When safety relief devices are prohibited, containers may be equipped with solid steel plugs in the safety device openings.

[2] The detachable protective housing for the loading and unloading valves must withstand tank test pressure without leakage and must be approved by the Bureau of Explosives.

[3] All parts of valves and safety relief devices in contact with the lading must be of a metal or other material, suitably treated if necessary, which will not cause formation of any acetylides.

[4] Tanks for nitrosyl chloride must be nickel-clad.

[5] Each valve outlet must be sealed by a threaded cap or a threaded solid plug.

[6] Valves must be protected by a metal cover.

[7] Safety relief devices for hydrogen sulfide must be of the fusible plug type utilizing a fusible alloy with yield temperature not over 170° F, nor less than 157° F. Each device must be resistant to extrusion of the fusible alloy and leak tight at 130° F.

SUBPART F

SPECIFICATIONS FOR CRYOGENIC LIQUID TANK CAR TANKS AND SEAMLESS STEEL TANKS (CLASS DOT-113 AND 107A)

§ 179.400 General specifications applicable to cryogenic liquid tank car tanks.

§ 179.400-1 General.
A tank built to specifications must comply with §§ 179.400 and 179.401.

§ 179.400-2 Approval.
See § 179.3 for approval procedure.

§ 179.400-3 Type.

(a) A tank built to this specification must—

(1) Consist of an inner tank of circular cross section supported essentially concentric within an outer jacket of circular cross section, with the out of roundness of both the inner tank and outer jacket limited in accordance with Section VIII, Division I, Paragraph UG-80 of the ASME Code;

(2) Have the annular space evacuated after filling the annular space with an approved insulating material;

(3) Have the inner tank heads designed concave to pressure; and

(4) Have the outer jacket heads designed convex to pressure.

(b) The tank must be equipped with piping systems for vapor venting and transfer of lading, and with pressure relief devices, controls, gages and valves, as prescribed herein.

§ 179.400-4 Insulation system and performance standard.

(a) For the purposes of this specification—

(1) **Standard Heat Transfer Rate** (SHTR), expressed in Btu/day/lb. of water capacity, means the rate of heat transfer used for determining the satisfactory performance of the insulation system of a cryogenic tank car tank in cryogenic liquid service (see § 179.401-1 Table).

(2) **Test cryogenic liquid** means the cryogenic liquid, which may be different from the lading intended to be shipped in the tank, being used during the performance tests of the insulation system.

(3) **Normal evaporation rate** (NER), expressed in lbs. (of the cryogenic liquid)/day, means the rate of evaporation, determined by test of a test cryogenic liquid in a tank maintained at a pressure of approximately one atmosphere, absolute. This determination of the NER is the NER test.

(4) **Stabilization period** means the elapsed time after a tank car tank is filled with the test cryogenic liquid until the NER has stabilized, or 24 hours has passed, whichever is greater.

(5) **Calculated heat transfer rate.** The calculated heat transfer rate (CHTR) is determined by the use of test data obtained during the NER test in the formula:

$$q = [N \Delta h (90 - t_\ell)] / [V(8.32828)(t_s - t_\ell)]$$

Where:

q = CHTR, in Btu/day/lb., of water capacity;
N = NER, determined by NER test, in lbs./day;
Δh = latent heat of vaporization of the test cryogenic liquid at the NER test pressure of approximately one atmosphere, absolute, in Btu/lb.;
90 = ambient temperature at 90° F.;
V = gross water volume at 60° F. of the inner tank, in gallons;
t_ℓ = equilibrium temperature of intended lading at maximum shipping pressure, in °F.;
8.32828 = constant for converting gallons of water at 60° F. to lbs. of water at 60° F., in lbs./gallon.

For explanation of abbreviations and reference marks, see last page of this tariff.

t_a = average temperature of outer jacket, determined by averaging jacket temperatures at various locations on the jacket at regular intervals during the NER test in °F;
t_b = equilibrium temperature of the test cryogenic liquid at the NER test pressure of approximately one atmosphere, absolute, in °F.

(b) DOT-113A60W tank cars must—
(1) Be filled with hydrogen, cryogenic liquid to the maximum permitted fill density specified in § 173.319(d)(2) Table of this subchapter prior to performing the NER test; and
(2) Have a CHTR equal to or less than the SHTR specified in § 179.401-1 table for a DOT-113A60W tank car.
(c) DOT-113C120W tank cars must—
(1) Be filled with ethylene, cryogenic liquid to the maximum permitted fill density specified in § 173.319(d)(2) Table of this subchapter prior to performing the NER test, or be filled with nitrogen, cryogenic liquid to 90 percent of the volumetric capacity of the inner tank prior to performing the NER test; and
(2) Have a CHTR equal to or less than 75 percent of the SHTR specified in § 179.401-1 Table for a DOT-113C120W tank car.
(d) Insulating materials must be approved.
(e) If the insulation consists of a powder having a tendency to settle, the entire top of the cylindrical portion of the inner tank must be insulated with a layer of glass fiber insulation at least one-inch nominal thickness, or equivalent, suitably held in position and covering an area extending 25 degrees to each side of the top center line of the inner tank.
(f) The outer jacket must be provided with fittings to permit effective evacuation of the annular space between the outer jacket and the inner tank.
(g) A device to measure the absolute pressure in the annular space must be provided. The device must be portable with an easily accessible connection or permanently positioned where it is readily visible to the operator.

§ 179.400-5 Materials.

(a) Stainless steel of ASTM Specification A240, Type 304 or 304L must be used for the inner tank and its appurtenances, as specified in AAR Specifications for Tank Cars, Appendix M, and must be—
(1) In the annealed condition prior to fabrication, forming and fusion welding;
(2) Suitable for use at the temperature of the lading; and
(3) Compatible with the lading.
(b) Any steel casting, steel forging, steel structural shape or carbon steel plate used to fabricate the outer jacket or heads must be as specified in AAR Specifications for Tank Cars, Appendix M.
(c) Impact tests must be—
(1) Conducted in accordance with AAR Specifications for Tank Cars, Appendix W, W-9.01;
(2) Performed on logitudinal specimens of the material;
(3) Conducted at the tank design service temperature or colder; and
(4) Performed on test plate welds and materials used for inner tanks and appurtenances and which will be subjected to cryogenic temperatures.
(d) Impact test values must be equal to or greater than those specified in AAR Specifications for Tank Cars, Appendix W. The report of impact tests must include the test values and lateral expansion data.

§ 179.400-6 Bursting and buckling pressure.

(a) The inner tank shall have a bursting pressure no less than that listed in § 179.401-1.
(b) The outer jacket of the required evacuated insulation system must be designed in accordance with § 179.400-7(d) and in addition must comply with the design loads specified in Section 6.2 of the AAR Specifications for Tank Cars. The designs and calculations must provide for the loadings transferred to the outer jacket through the support system.

§ 179.400-7 Tank heads.

(a) Tank heads of the inner tank and outer jacket must be flanged and dished, or ellipsoidal.
(b) Flanged and dished heads must have—
(1) A main inside dish radius not greater than the outside diameter of the straight flange;
(2) An inside knuckle radius of not less than 6 percent of the outside diameter of the straight flange; and
(3) An inside knuckle radius of at least three-times the head thickness.

§ 179.400-8 Thickness of plates.

(a) The minimum wall thickness, after forming, of the inner shell and any 2:1 ellipsoidal head for the inner tank must be that specified in § 179.401-1, or that calculated by the following formula, whichever is greater:

$$t = Pd/2SE$$

Where:
t = minimum thickness of plate, after forming, in inches;
P = minimum required bursting pressure, in psi;
d = inside diameter, in inches;
S = minimum tensile strength of the plate material, as prescribed in AAR Specifications for Tank Cars, Appendix M, Table M-1, in psi;
E = 0.9, a factor representing the efficiency of welded joints, except that for seamless heads, $E = 1.0$.

(b) The minimum wall thickness, after forming, of any 3:1 ellipsoidal head for the inner tank must be that specified in § 179.401-1, or that calculated by the following formula, whichever is greater:

$$t = 1.83\,Pd/2SE$$

Where:
t = minimum thickness of plate, after forming, in inches;
P = minimum required bursting pressure, in psi;
d = inside diameter, in inches;
S = minimum tensile strength of the plate material, as prescribed in AAR Specifications for Tank Cars, Appendix M, Table M-1, in psi;
E = 0.9, a factor representing the efficiency of welded joints, except that for seamless heads, $E = 1.0$.

(c) The minimum wall thickness, after forming, of a flanged and dished head for the inner tank must be that specified in § 179.401-1, or that calculated by the following formula, whichever is greater:

$$t = [PL(3 + \sqrt{(L/r)})]/(8SE)$$

Where:
t = minimum thickness of plate, after forming, in inches;
P = minimum required bursting pressure, in psi;
L = main inside radius of dished head, in inches;
r = inside knuckle radius, in inches;
S = minimum tensile strength of plate material, as prescribed in AAR Specifications for Tank Cars, Appendix M, Table M-1, in psi;
E = 0.9, a factor representing the efficiency of welded joints, except that for seamless heads, $E = 1.0$.

(d) The minimum wall thickness, after forming, of the outer jacket shell may not be less than 7/16 inch. The minimum wall thickness, after forming, of the outer jacket heads may not be less than 1/2 inch and they must be made from steel specified in § 179.100-23(a)(1). The annular space is to be evacuated, and the cylindrical portion of the outer jacket between heads, or between stiffening rings if used, must be designed to withstand an external pressure of 37.5 psi (critical collapsing pressure), as determined by the following formula:

$$P_c = [2.6E(t/D^{5/3})]/[L/D) - 0.45(t/D)^{5/2}]$$

Where:
P_c = Critical collapsing pressure (37.5 psi minimum), in psi;
e = modulus of elasticity of jacket material, in psi;
t = minimum thickness of jacket material, after forming, in inches;
O = outside diameter of jacket, in inches;
L = distance between stiffening ring centers in inches. (The heads may be considered as stiffening rings located 1/3 of the head depth from the head tangent line.)

§ 179.400-9 Stiffening rings.

(a) If stiffening rings are used in designing the cylindrical portion of the outer jacket for external pressure, they must be attached to the jacket by means of fillet welds. Outside stiffening ring attachment welds must be continuous on each side of the ring. Inside stiffening ring attachment welds may be intermittent welds on each side of the ring with the total length of weld on each side not less than one-third of the circumference of the tank. The maximum space between welds may not exceed eight times the outer jacket wall thickness.
(b) A portion of the outer jacket may be included when calculating the moment of inertia of the ring. The effective width of jacket plate on each side of the attachment of the stiffening ring is given by the following formula:

$$W = 0.78\sqrt{Rt^3}$$

Where:
W = width of jacket effective on each side of the stiffening ring, in inches;
R = outside radius of the outer jacket, in inches;
t = plate thickness of the outer jacket, after forming, in inches.

(c) Where a stiffening ring is used that consists of a closed section having two webs attached to the outer jacket, the jacket plate between the webs may be included up to the limit of twice the value of "W", as defined in paragraph (B) of this section. The outer flange of the closed section, if not a steel structural shape, is subject to the same limitations with "W" based on the "R" and "t" values of the flange. Where two separate members such as two angles, are located less than "2W" apart they may be treated as a single stiffening ring member. (The maximum length of plate which may be considered effective is 4W.) The closed section between an external ring and the outer jacket must be provided with a drain opening.
(d) The stiffening ring must have a moment of inertia large enough to support the critical collapsing pressure, as determined by either of the following formulas:

$$I = [0.035D^2L_sP_c]/E, \text{ or}$$
$$I = [0.046D^2L_sP_c]/E$$

Where:
I = required moment of inertia of stiffening ring about the centroidal axis parallel to the vessel axis, in inches to the fourth power;
I' = required moment of inertia of combined section of stiffening ring and effective width of jacket plate about the centroidal axis parallel to the vessel axis, in inches to the fourth power;

D = outside diameter of the outer jacket, in inches;
L = one half of the distance from the centerline of the stiffening ring to the next line of support on one side, plus one half of the distance from the centerline to the next line of support on the other side of stiffening ring. Both distances are measured parallel to the axis of the vessel, in inches. (A line of support is
(1) A stiffening ring which meets the requirements of this paragraph, or
(2) A circumferential line of a head at one third the depth of the head from the tangent line);
P_c = critical collapsing pressure (37.5 psi minimum), in psi;
E = modulus of elasticity of stiffening ring material, in psi

(e) Where loads are applied to the outer jacket or to stiffening rings from the system used to support the inner tank within the outer jacket, additional stiffening rings, or an increased moment of inertia of the stiffening rings designed for the external pressure, must be provided to carry the support loads.

§ 179.400-10 Sump or siphon bowl.

A sump or siphon bowl may be in the bottom of the inner tank shell if—
(a) It is formed directly into the inner tank shell, or is formed and welded to the inner tank shell and is of weldable quality metal that is compatible with the inner tank shell;
(b) The stress in an orientation under any condition does not exceed the circumferential stress in the inner tank shell; and
(c) The wall thickness is not less than that specified in § 179.401-1.

§ 179.400-11 Welding.

(a) Except for closure of openings and a maximum of two circumferential closing joints in the cylindrical portion of the outer jacket, each joint of an inner tank and the outer jacket must be a fusion double welded butt joint.
(b) The closure for openings and the circumferential closing joints in the cylindrical portion of the outer jacket, including head to shell joints, may be a single welded butt joint using a backing strip on the inside of the joint.
(c) Each joint must be welded in accordance with the requirements of AAR Specifications for Tank Cars, Appendix W.
(d) Each welding procedure, welder, and fabricator must be approved.

§ 179.400-12 Postweld heat treatment.

(a) Postweld heat treatment of the inner tank is not required.
(b) The cylindrical portion of the outer jacket, with the exception of the circumferential closing seams, must be postweld heat treated as prescribed in AAR Specifications for Tank Cars, Appendix W. Any item to be welded to this portion of the outer jacket must be attached before postweld heat treatment. Welds securing the following need not be postweld heat treated when it is not practical due to final assembly procedures:
(1) the inner tank support system to the outer jacket,
(2) connections at piping penetrations,
(3) closures for access openings, and
(4) circumferential closing joints of head to shell joints.
(c) When cold formed heads are used on the outer jacket they must be heat treated before welding to the jacket shell if postweld heat treatment is not practical due to assembly procedures.

§ 179.400-13 Support system for inner tank.

(a) The inner tank must be supported within the outer jacket by a support system of approved design. The system and its areas of attachment to the outer jacket must have adequate strength and ductility at operating temperatures to support the inner tank when filled with the lading to any level incident to transportion.
(b) The support system must be designed to support, without yielding, impact loads producing accelerations of the following magnitudes and directions when the inner tank is fully loaded and the car is equipped with a conventional draft gear:

Longitudinal	7"g"
Transverse	3"g"
Vertical	3"g"

The longitudinal acceleration may be reduced to 3"g" where a cushioning device of approved design, which has been tested to demonstrate its ability to limit body forces to 400,000 pounds maximum at 10 miles per hour, is used between the coupler and the tank structure.
(c) The inner tank and outer jacket must be permanently bonded to each other electrically, by either the support system, piping, or a separate electrical connection of approved design.

§ 179.400-14 Cleaning of inner tank.

The interior of the inner tank and all connecting lines must be thoroughly cleaned and dried prior to use. Proper precautions must be taken to avoid contamination of the system after cleaning.

§ 179.400-15 Radioscopy.

Each longitudinal and circumferential joint of the inner tank, and each longitudinal and circumferential double welded butt joint of the outer jacket, must be examined along its entire length in accordance with the requirements of AAR Specifications for Tank Cars, Appendix W.

§ 179.400-16 Access to inner tank.

(a) The inner tank must be provided with a means of access having a minimum inside diameter of 16 inches. Reinforcement of the access opening must be made of the same material used in the inner tank. The access closure must be of an approved material and design.
(b) If a welded closure is used, it must be designed to allow it to be reopened by grinding or chipping and to be closed again by rewelding, preferably without a need for new parts. A cutting torch may not be used.

§ 179.400-17 Inner tank piping.

(a) **Product lines.** The piping system for vapor and liquid phase transfer and venting must be made for material compatible with the product and having satisfactory properties at the lading temperature. The outlets of all vapor phase and liquid phase lines must be located so that accidental discharge from these lines will not impinge on any metal of the outer jacket, car structures, trucks or safety appliances. Suitable provision must be made to allow for thermal expansion and contraction.
(1) loading and unloading line.
A liquid phase transfer line must be provided and it must have a manually operated shut-off valve located as close as practicable to the outer jacket, plus a secondary closure that is liquid and gas tight. This secondary closure must permit any trapped pressure to bleed off before the closure can be removed completely. A vapor trap must be incorporated in the line and located as close as practicable to the inner tank. On a DOT-113A60W tank car, any loading and unloading line must be vacuum jacketed between the outer jacket and the shut-off valve and the shut-off valve must also be vacuum jacketed.
(2) Vapor phase line.
A vapor phase line must connect to the inner tank and must be of sufficient size to permit the pressure relief devices specified in § 179.400-20 and connected to this line to operate at their design capacity without excessive pressure build-up in the tank. The vapor phase line must have a manually operated shut-off valve located as close as practicable to the outer jacket, plus a secondary closure that is liquid and gas tight. This secondary closure must permit any trapped pressure to bleed off before the closure can be removed completely.
(3) **Vapor phase blowdown line.** A blowdown line must be provided. It must be attached to the vapor phase line specified in paragraph (a)(2) of this section, upstream of the shut-off valve in that line. A by-pass line with a manually operated shut-off valve must be provided to permit reduction of the inner tank pressure when the vapor phase line is connected to a closed system. The discharge from this line must be outside the housing and must be directed upward and away from operating personnel.
(b) Any pressure building system provided for the purpose of pressurizing the vapor space of the inner tank to facilitate unloading the liquid lading must be approved.

§ 179.400-18 Test of inner tank.

(a) After all items to be welded to the inner tank have been welded in place, the inner tank must be pressure tested at the test pressure prescribed in § 179.401-1. The temperature of the pressurizing medium may not exceed 100° F. during the test. The inner tank must hold the prescribed pressure for a period of not less than ten minutes without leakage or distortion. In a pneumatic test, due regard for the protection of all personnel should be taken because of the potential hazard involved. After a hydrostatic test the container and piping must be emptied of all water and purged of all water vapor.
(b) Caulking of welded joints to stop leaks developed during the test is prohibited. Repairs to welded joints must be made as prescribed in AAR Specifications for Tank Cars, Appendix W.

179.400-19 Valves and gages.

(a) **Valves.** Manually operated shut-off valves and control valves must be provided wherever needed for control of vapor phase pressure, vapor phase venting, liquid transfer and liquid flow rates. All valves must be made from approved materials compatible with the lading and having satisfactory properties at the lading temperature.
(1) Liquid control valves must be of extended stem design.
(2) Packing, if used, must be satisfactory for use in contact with the lading and of approved materials that will effectively seal the valve stem without causing difficulty of operation.
(3) Each control valve and shut-off valve must be readily operable. These valves must be mounted so that their operation will not transmit excessive forces to the piping system.
(b) **Gages.** Gages, except portable units, must be securely mounted within suitable protective housings. A liquid level gage and a vapor phase pressure gage must be provided as follows:
(1) Liquid level gage.
(i) A gage of approved design to indicate the quantity of liquefied lading within the inner tank, mounted where it will be readily visible to an operator during transfer operations or storage, or a portable gage with a readily accessible connection, or
(ii) A fixed length dip tube, with a manually operated shut-off valve

located as close as practicable to the outer jacket. The dip tube must indicate the maximum liquid level for the allowable filling density. The inner end of the dip tube must be located on the longitudinal centerline of the inner tank and within four feet of the transverse centerline of the inner tank.

(2) Vapor phase pressure gage. A vapor phase pressure gage of approved design, with a manually operated shut-off valve located as close as practicable to the outer jacket. The gage must indicate the vapor pressure within the inner tank and must be mounted where it will be readily visible to an operator. An additional fitting for use of a test gage must be provided.

§ 179.400-20 Pressure relief devices.

(a) The tank must be provided with pressure relief devices for the protection of the tank assembly and piping system. The discharge from these devices must be directed away from operating personnel, principal load bearing members of the outer jacket, car structure, trucks and safety appliances. Vent or weep holes in pressure relief devices are prohibited. All main pressure relief devices must discharge to the outside of the protective housings in which they are located, except that this requirement does not apply to pressure relief valves installed to protect isolated sections of lines between the final valve and end closure.

(b) Materials. Materials used in pressure relief devices must be suitable for use at the temperature of the lading and otherwise compatible with the lading in both the liquid and vapor phases.

(c) Inner tank. Pressure relief devices for the inner tank must be attached to vapor phase piping and mounted so as to remain at ambient temperature prior to operation. The inner tank must be equipped with one or more pressure relief valves and one or more safety vents (except as noted in paragraph (c)(3)(iv) of this section), and installed without an intervening shut-off valve (except as noted in paragraph (c)(3)(iii) of this section). Additional requirements are as follows:

(1) Safety vent. The safety vent shall function at the pressure specified in §179.401-1. The safety vent must be flow rated in accordance with the applicable provisions of AAR Specifications for Tank Cars, Appendix A, and provide sufficient capacity to meet the requirements of AAR Specifications for Tanks Cars, Appendix A, A8.07(a).

(2) Pressure relief valve. The pressure relief valve must:

(i) be set to start-to-discharge at the pressure specified in §179.401-1, and

(ii) meet the requirements of AAR Specifications for Tank Cars, Appendix A, A8.07(b).

(3) Installation of safety vent and pressure relief valve.

(i) Inlet piping.

(A) The opening through all piping and fittings between the inner tank and its pressure relief devices must have a cross-sectional area at least equal to that of the pressure relief device inlet, and the flow characteristics of this upstream system must be such that the pressure drop will not adversely affect the relieving capacity or the proper operation of the pressure relief device.

(B) When the required relief capacity is met by the use of multiple pressure relief device placed on one connection, the inlet internal cross-sectional area of this connection must be sufficient to provide the required flow capacity for the proper operation of the pressure relief device system.

(ii) Outlet piping.

(A) The opening through the discharge lines must have a cross-sectional area at least equal to that of the pressure relief device outlet and may not reduce the relieving capacity below that required to properly protect the inner tank.

(B) When the required relieving capacity is met by use of multiple pressure relief devices placed on a common discharge manifold, the manifold outlet internal cross-sectional area must be at least equal to the combined outlet areas of the pressure relief devices.

(iii) Duplicate pressure relief devices may be used when an approved 3-way selector valve is installed to provide for relief through either duplicate pressure relief device. The 3-way valve must be included in the mounting prescribed by AAR Specifications for Tank Cars, Appendix A, A6.02(g), when conducting the flow capacity test on the safety vent prescribed by AAR Specifications for Tank Cars, Appendix A, A6.01. Flow capacity tests must be performed with the 3-way valve at both of the extreme positions as well as at the mid-position and the flow capacity must be in accordance with AAR Specifications for Tank CArs, Appendix A, A8.07(a).

(iv) An alternate pressure relief valve, set as required in §179.401-1, may be used in lieu of the safety vent, provided it meets the flow capacity prescribed in AAR Specifications for Tank Cars, Appendix A at a flow rating pressure of 110 percent of its start-to-discharge pressure. Installation must—

(A) Prevent moisture accumulation at the seat by providing drainage away from the area,

(B) Permit periodic drainage of the vent piping, and

(C) Prevent accumulation of foreign material in the vent system.

(4) Evaporation control. The routine release of vaporized lading may be controlled with a pressure controlling and mixing device, except that a pressure controlling and mixing device is required on each DOT-113A60W car. Any pressure controlling and mixing device must—

(i) Be set to start-to-discharge at a pressure not greater than that specified in §179.401-1;

(ii) Have sufficient capacity to limit the pressure within the inner tank to that pressure specified in §179.401-1, when the discharge is equal to twice the normal venting rate during transportation, with normal vacuum and the outer shell at 130° F; and

(iii) Prevent the discharge of a gas mixture exceeding 50% of the lower flammability limit to the atmosphere under normal conditions of storage or transportation.

(5) Safety interlock. If a safety interlock is provided for the purpose of allowing transfer of lading at a pressure higher than the pressure control valve setting but less than the pressure relief valve setting, the design must be such that the safety interlock will not affect the discharge path of the pressure relief valve or safety vent at any time. The safety interlock must automatically provide an unrestricted discharge path for the pressure control device at all times when the tank car is in transport service.

(d) Outer jacket. The outer jacket must be provided with a suitable system to prevent buildup of annular space pressure in excess of 16 psig or the external pressure for which the inner tank was designed, whichever is less. The total relief area provided by the system must be a minimum of 25 square inches, and means must be provided to prevent clogging of any system opening, as well as to ensure adequate communication to all areas of the insulation space. If a safety vent is a part of the system, it must be designed to prevent distortion of the frangible disc when the annular space is evacuated.

(e) Piping system. Where a piping circuit can be isolated by closing a valve, means for pressure relief must be provided.

§ 179.400-21 Test of pressure relief valves.

Each valve must be tested with air or gas for compliance with §179.401-1 before being put into service.

§ 179.400-22 Protective housings.

Each valve, gage, closure and pressure relief device, with the exception of secondary relief valves for the protection of isolated piping, must be enclosed within a protective housing. The protective housing must be adequate to protect the enclosed components from direct solar radiation, mud, sand, adverse environmental exposure and mechanical damage incident to normal operation of the tank car. It must be designed to provide reasonable access to the enclosed components for operation, inspection and maintenance and so that vapor concentrations cannot build up to a dangerous level inside the housing in the event of valve leakage or pressure relief valve operation. All equipment within the protective housing must be operable by personnel wearing heavy gloves and must incorporate provisions for locks or seals. A protective housing and its cover must be constructed of metal not less than 0.119 inch thick.

§ 179.400-23 Operating instructions.

All valves and gages must be clearly identified with corrosion-resistant nameplates. A plate of corrosion-resistant material bearing precautionary instructions for the safe operation of the equipment during storage and transfer operations must be securely mounted so as to be readily visible to an operator. The instruction plate must be mounted in each housing containing operating equipment and controls for product handling. These instructions must include a diagram of the tank and its piping system with the various gages, control valves and pressure relief devices clearly identified and located.

§ 179.400-24 Stamping.

(a) A tank that complies with all specification requirements must have the following information plainly and permanently stamped into the metal near the center of the head of the outer jacket at the "B" end of the car, in letters and figures at least ⅜-inch high, in the following order:

	Example of required stamping
Specification	DOT-113A60W
Design service temperature	Minus 423 F
Inner tank	Inner Tank
Material	ASTM A240-304
Shell thickness	Shell 7/16 inch
Head thickness	Head 7/16 inch
Inside diameter	ID 107 inch
Inner tank builder's initials	ABC
Date of original test (month and year) and initials of person conducting original test	00-0000GHK
Water capacity	00000 lbs
Outer jacket	Outer jacket
Material	ASTM A515-70
Outer jacket builder's initials	DEF
Car assembler's initials (if other than inner tank or outer jacket builder)	XYZ

(b) Any stamping on the shell or heads of the inner tank is prohibited.

(c) In lieu of the stamping required by paragraph (a) of this section, the specified markings may be incorporated on a data plate of corrosion-

resistant metal, fillet welded in place on the head of the outer jacket at the "B" end of the car.

§ 179.400-25 Stenciling.

Each tank car must be stenciled in compliance with the provisions of the AAR Specifications for Tank Cars, Appendix C. The stenciling must also include the following:

(a) The date on which the frangible disc was last replaced and the initials of the person making the replacement, on the outer jacket in letters and figures at least 1½ inches high.

(b) The design service temperature and maximum lading weight, in letters and figures at least 1½ inches high adjacent to the hazardous material stencil.

(c) The water capacity, in pounds net at 60° F., with the tank at its coldest operating temperature, after deduction for the volume above the inlet to the pressure relief device or pressure control valve, structural members, baffles, piping, and other appurtenances inside the tank, in letters and figurs at least 1½ inches high.

(d) Both sides of the tank car, in letters at least 1½ inches high, with the statement "Do Not Hump or Cut Off While in Motion."

(e) The outer jacket, below the tank classification stencil, in letters at least 1½ inches high, with the statement, "Vacuum jacketed."

§ 179.400-26 Certificate of construction.

See §179.5.

§ 179.401 Individual specification requirements applicable to inner tanks for cryogenic liquid tank car tanks.

§ 179.401-1 Individual specification requirements.

In addition to §179.400, the individual specification requirements for the inner tank and its appurtenances are as follows:

DOT specification	113A60W	113C120W
Design service temperature, °F.	-423	-260
Material	§179.400-5	§179.400-5.
Impact test (weld and plate material)	§179.400-5(c)	§179.400-5(c).
Impact test values	§179.400-5(d)	§179.400-5(d).
Standard heat transfer rate: (Btu per day per lb. of water capacity, max.) (see §179.400-4)	0.097	0.4121.
Bursting pressure, min. psi	240	300
Minimum plate thickness shell, inches (see §179.400-7(a))	7/16	7/16.
Minimum head thickness, inches (see §179.400-7 (a), (b), and (c))	7/16	7/16.
Test pressure, psi (see §179.400-16)	60	120
Safety vent bursting pressure, max. psi	60	120.
Pressure relief valve start-to-discharge pressure, psi (± 3 psi)	30	75.
Pressure relief valve vapor tight pressure, min. psi	24	60
Pressure relief valve flow rating pressure, max. psi	40	85
Alternate pressure relief valve start-to-discharge pressure, psi (± 3 psi)		90
Alternate pressure relief valve vapor tight pressure, min. psi		72
Alternate pressure relief valve flow rating pressure, max. psi		100
Pressure control valve	17	Not required
Start-to-vent, max. psi (see §179.400-20(c)(4).)		
Relief device discharge restrictors	§179.400-20	§179.400-20
Transfer line insulation	§179.400-17	Not required.

§ 179.500 Specification DOT-107A* * * * seamless steel tank car tanks.

§ 179.500-1 Tanks built under these specifications shall meet the requirements of §179.500.

§ 179.500-2 Approval. (a) For procedure for securing approval, see §179.3.

§ 179.500-3 Type and general requirements. (a) Tanks built under this specification shall be hollow forged or drawn in one piece. Forged tanks must be machined inside and outside before ends are necked-down and, after necking-down, the ends must be machined to size on the ends and outside diameter. Machining not neccessary on inside or outside of seamless steel tubing, but required on ends after necking-down.

(b) For tanks made in foreign countries, chemical analysis of material and all tests as specified must be carried out within the limits of the United States under supervision of a competent and disinterested inspector; in addition to which, provisions in §179.500 and §179.500-18(c) must be carried out at the point of manufacture by a recognized inspection bureau with principal office in the United States.

(c) The terms "marked end" and "marked test pressure" used throughout this specification are defined as follows:

(1) "Marked end" is that end of the tank on which marks prescribed in §179.500-17 are stamped.

(2) "Marked test pressure" is that pressure in pounds per square inch which is indicated by the figures substituted for the * * * * in the marking DOT-107A * * * * stamped on the marked end of tank.

(d) The gas pressure at 130° F. in the tank shall not exceed 7/10 of the marked test pressure of the tank.

§ 179.500-4 Thickness of wall. (a) Minimum thickness of wall of each finished tank shall be such that at a pressure equal to 7/10 of the marked test pressure of the tank, the calculated fiber stress in pounds per square inch at inner wall of tank multiplied by 3.0 will not exceed the tensile strength of any specimen taken from the tank and tested as prescribed in §179.500-7(b). Minimum wall thickness shall be ¼ inch.

(b) Calculations to determine the maximum marked test pressure permitted to be marked on the tank shall be made by the formula:

$$P = \frac{10S\,(D^2 - d^2)}{7\,(D^2 + d^2)}$$

where:

P = Maximum marked test pressure permitted;

$S = \frac{U}{3.0}$

where:

U = Tensile strength of that specimen which shows the lower tensile strength of the two specimens taken from the tank, and tested as prescribed in §179.500-7(b).

3 = Factor of safety

$\frac{D^2 - d^2}{D^2 + d^2}$ = The smaller value obtained for this factor by the operations specified in §179.500-4(c).

(c) Measure at one end, in a plane perpendicular to the longitudinal axis of the tank and at least 18 inches form that end before necking-down:

d = Maximum inside diameter (inches) for the location under consideration; to be determined by direct measurement to an accuracy of 0.05 inch.

t = Minimum thickness of wall for the location under consideration; to be determined by direct measurement to an accuracy of 0.001 inch.

Take D = d + 2t.

Calculate the value of $\frac{D^2 - d^2}{D^2 + d^2}$

(1) Make similar measurements and calculation for a corresponding location at the other end of the tank.

(2) Use the smaller result obtained, from the foregoing, in making calculations prescribed in paragraph (b) of this section.

§ 179.500-5 Material. (a) Tanks shall be made from openhearth or electric steel of uniform quality. Material must be free from seams, cracks, laminations, or other defects injurious to finished tank. If not free from such defects, the surface may be machined or ground to eliminate these defects. Forgings and seamless tubing for bodies of tanks must be stamped with heat numbers.

(b) Steel (see Note 1) must conform to the following requirements as to chemical composition:

Designation	Class I (percent)	Class II (percent)	Class III (percent)
Carbon, maximum	0.50	0.50	0.53
Manganese, maximum	1.65	1.65	1.85
Phosphorus, maximum	.05	.05	.05
Sulphur, maximum	.06	.05	.05
Silicon, maximum	.35	.30	.37
Molybdenum, maximum	....	.25	.30
Chromium, maximum	....	.30	.30
Sum of manganese and carbon not over	2.10	2.10	....

Note 1: Alternate steel containing other alloying elements may be used if approved

(1) For instructions as to the obtaining and checking of chemical analysis, see §179.500-18(b)(3).

§ 179.500-6 Heat treatment. (a) Each necked-down tank shall be uniformly heat treated. Heat treatment shall consist of annealing or normalizing and tempering for Class I, Class II and Class III steel or oil quenching and tempering for Class III steel. Tempering temperatures shall not be less than 1000 F. Heat treatment of alternate steels must be approved. All scale must be removed from outside of tank to an extent sufficient to allow proper inspection.

(b) To check uniformity of heat treatment, Brinnel hardness tests shall be made at 18 inch intervals on the entire longitudinal axis. The hardness must not vary more than 35 points in the length of the tank. No hardness tests need be taken within 12 inches from point of head to shell tangency.

(c) A magnetic particle inspection shall be performed after heat treatment on all tanks subjected to a quench and temper treatment to detect the presence of quenching cracks. Cracks shall be removed to sound metal by grinding and the surface exposed shall be blended smoothly into the surrounding area. A wall thickness check shall then be made of the affected area by ultrasonic equipment or other suitable

means acceptable to the inspector and if the remaining wall thickness is less than the minimum recorded thickness as determined by § 179.500-4(b) it shall be used for making the calculation prescribed in § 179.500-6(b).

§ 179.500-7 Physical tests. (a) Physical tests shall be made on 2 test specimens 0.505 inch in diameter within 2-inch gage length, taken 180 degrees apart, 1 from each ring section cut from each end of each forged or drawn tube before necking-down, or 1 from each prolongation at each end of each necked-down tank. These test specimen ring sections or prolongations must be heat treated with the necked-down tank which they represent. The width of the test specimen ring section must be at least its wall thickness. Only when diameters and wall thickness will not permit removal of 0.505 by 2-inch tensile test bar, laid in the transverse direction, may test bar cut in the longitudinal direction be substituted. When the thickness will not permit obtaining a 0.505 specimen, then the largest diameter specimen obtainable in the longitudinal direction shall be used. Specimens shall have bright surface and a reduced section. When 0.505 specimen is not used the gage length shall be a ratio of 4 to 1 length to diameter.

(b) Elastic limit as determined by extensometer, shall not exceed 70 percent of tensile strength for Class I steel or 65 percent of tensile strength for Class II and Class III steel. Determination shall be made at cross head speed of not more than 0.125 inch per minute with an extensometer reading to 0.0002 inch. The extensometer shall be read at increments of stress not exceeding 5,000 pounds per square inch. The stress at which the strain first exceeds.

$$\frac{\text{stress (pounds per square inch)}}{30{,}000{,}000 \text{ (pounds per square inch)}} + 0.005 \text{ (inches per inch)}$$

shall be recorded as the elastic limit.

(1) Elongation shall be at least 18 percent and reduction of area at least 35 percent.

Note 1. Upon approval, the ratio of elastic limit to ultimate strength may be raised to permit use of special alloy steels of definite composition that will give equal or better physical properties than steels herein specified.

§ 179.500-8 Openings in tanks. (a) Each end shall be closed by a cover made of forged steel. Covers must be secured to ends of tank by through bolts or studs not entering interior of tank. Covers must be of a thickness sufficient to meet test requirements of § 179.500-12 and to compensate for the openings closed by attachments prescribed herein.

(1) It is also provided that each end may be closed by internal threading to accommodate an approved fitting. The internal threads as well as the threads on fittings for these openings shall be clean cut, even, without checks, and tapped to gage. Taper threads are required and shall be of a length not less than as specified for American Standard taper pipe threads. External threading of an approved type shall be permissible on the internal threaded ends.

(b) Joints between covers and ends and between cover and attachments shall be of approved form and made tight against vapor or liquid leakage by means of a confined gasket of suitable material.

§ 179.500-9 Tank mounting. (a) For tank mounting, see § 179.10.

§ 179.500-10 Protective housing. (a) Safety relief devices, and loading and unloading valves on tanks shall be protected from accidental injury by approved metal housing, arranged so it may be readily opened to permit inspection and adjustment of safety relief devices and valves, and securely locked in closed position. Housing shall be provided with opening having an opening equal to twice the total discharge area of safety relief device enclosed.

§ 179.500-12 Safety relief devices. (a) Tank shall be equipped with one or more safety relief devices of approved type and discharge area, mounted on the cover or threaded into the non-marked end of the tank. If fittings are mounted on a cover, they shall be of the flanged type, made of metal not subject to rapid deterioration by lading or in service. Total flow capacity shall be such that, with tank filled with air at pressure equal to 70 percent of the marked test pressure of tank, flow capacity will be sufficient to reduce air pressure to 30 percent of the marked test pressure within 3 minutes after safety relief device opens.

(b) Safety relief devices shall open at pressure not exceeding the marked test pressure of tank and not less than 7/10 of marked test pressure. (For tolerance for safety relief valves, see § 179.500-16(a).)

(c) Cars used for the transportation of flammable gases shall have the safety devices equipped with an approved ignition device.

§ 179.500-13 Fixtures. (a) Attachments, other than those mounted on tank covers or serving as threaded closures for the ends of the tank, are prohibited.

§ 179.500-14 Test of tanks. (a) After heat-treatment, tanks shall be subjected to hydrostatic tests in a water jacket, or by other accurate method, operated so as to obtain reliable data. No tank shall have been subjected previously to internal pressure greater than 90 percent of the marked test pressure. Each tank must be tested to a pressure at least equal to the marked test pressure of the tank. Pressure must be maintained for 30 seconds, and sufficiently longer to insure complete expansion of tank. Pressure gage must permit reading to accuracy of one percent. Expansion gage must permit reading of total expansion to accuracy of one percent. Expansion must be recorded in cubic centimeters.

(b) No leaks shall appear and permanent volumetric expansion shall not exceed 10 percent of the total volumetric expansion at test pressure.

§ 179.500-15 Handling of tanks failing in tests. (a) Tanks rejected for failure in any of the tests prescribed may be reheat-treated, and will be acceptable if subsequent to reheat-treatment they are subjected to and pass all of the tests.

§ 179.500-16 Tests of safety relief devices. (a) Safety relief valves shall be tested by air or gas before being put into service. Valve must open at pressure not exceeding the marked test pressure of tank and must be vapor-tight at 80 percent of the marked test pressure. These limiting pressures must not be affected by any auxiliary closure or other combination.

(b) For safety relief devices of frangible disc type, samples of discs used shall burst at a pressure not exceeding the marked test pressure of tank and not less than 7/10 of marked test pressure.

§ 179.500-17 Marking. (a) Each tank shall be plainly and permanently marked, thus certifying that tank complies with all requirements of this specification. These marks must be stamped into the metal of necked-down section of tank at marked end, in letters and figures at least ⅛ inch high, as follows:

(1) Spec. DOT-107A****, the **** to be replaced by figures indicating marked test pressure of the tank. This pressure shall not exceed the calculated maximum marked test pressure permitted, as determined by the formula in § 179.500-4(b).

(2) Serial number immediately below the stamped mark specified in paragraph (a)(1) of this section.

(3) Inspector's official mark immediately below the stamped mark specified in paragraph (a)(1) of this section.

(4) Name, mark (other than trademark), or initials of company or person for whose use tank is being made, which shall be recorded with the Bureau of Explosives.

(5) Date, (such as 1-62, for January 1962) of tank test, so placed that dates of subsequent tests may easily be added thereto.

(6) Date, (such as 1-62, for January 1962) of latest test of safety relief valve or of frangible disc, required only when tank is used for transportation of flammable gases.

(7) Name of gas for which tank car is being used, stenciled in letters at least 2 inches high on each side of car where they are clearly visible.

§ 179.500-18 Inspection and reports. (a) Before a tank car is placed in service, the party assembling the completed car shall furnish to car owner, Bureau of Explosives, and the Secretary, Mechanical Division, Association of American Railroads, a report in proper form certifying that tanks and their equipment comply with all the requirements of this specification and including information as to serial numbers, dates of tests, and ownership marks on tanks mounted on car structure.

(b) Purchaser of tanks shall provide for inspection by a competent inspector as follows:

(1) Inspector shall carefully inspect all material and reject that not complying with § 179.500-5.

(2) Inspector shall stamp his official mark on each forging or seamless tube accepted by him for use in making tanks, and must verify proper application of heat number to such material by occasional inspections at steel manufacturer's plant.

(3) Inspector shall obtain certified chemical analysis of each heat of material.

(4) Inspector shall make inspection of inside surface of tanks before necking-down, to insure that no seams, cracks, laminations, or other defects exist.

(5) Inspector shall fully verify compliance with specification, verify heat treatment of tank as proper; obtain samples for all tests and check chemical analyses; witness all tests; and report minimum thickness of tank wall, maximum inside diameter, and calculated value of D, for each end of each tank as prescribed in § 179.500-4(c).

(6) Inspector shall stamp his official mark on each accepted tank immediately below serial number, and make certified report (see paragraph (c) of this section) to builder, to company or person for whose use tanks are being made, to builder of car structure on which tanks are to be mounted, to the Bureau of Explosives, and to the Secretary, Mechanical Division, Association of American Railroads.

(c) Inspector's report required herein shall be in the following form:

Note 1: The marked test pressure substituted for the **** on each tank is shown on Record of General Data on Tanks attached hereto

Serial numbers ..... to ..... inclusive
Inspector's mark .....
Owner's mark .....
Test date .....
Water capacity (see Record of Hydrostatic Tests)
Tare weights (yes or no) (See Record of Hydrostatic Tests)
These tanks were made by process of .....

Steel used was identified as indicated by the attached list showing the serial number of each tank, followed by the heat number.

Steel used was verified as to chemical analysis and record thereof is attached hereto. Heat numbers were stamped into metal

All material was inspected and each tank was inspected both before and after closing in ends; all material accepted was found free from seams, cracks, laminations, and other defects which might prove injurious to strength of tank. Processes of manufacture and heat treatment of tanks were witnessed and found to be efficient and satisfactory.

Before necking-down ends, each tank was measured at each location prescribed in § 179.500-4(c) and minimum wall thickness in inches at each location was recorded, maximum inside diameter in inches at each location was recorded, value of D in inches at each location was calculated and recorded, maximum fiber stress in wall at location showing larger value for

$$\frac{D^2 + d^2}{D^2 - d^2}$$

was calculated for 7/10 the marked test pressure and recorded. Calculations were made by the formula

$$S = 0.7P\,\frac{(D^2 + d^2)}{(D^2 - d^2)}$$

Hydrostatic tests, tensile tests of material, and other tests as prescribed in this specification, were made in the presence of the inspector, and all material and tanks accepted were found to be in compliance with the requirements of this specification. Records thereof are attached hereto.

I hereby certify that all of these tanks proved satisfactory in every way and comply with the requirements of Department of Transportation Specification No. 107A****.

PART 397—TRANSPORTATION OF HAZARDOUS MATERIALS; DRIVING AND PARKING RULES

§ 397.1 Application of the rules in this part. (a) Except as provided in paragraph (c) of this section, the rules in this part apply to each motor carrier engaged in the transportation of hazardous materials by a motor vehicle which must be marked or placarded in accordance with §177.823 of this title and to—.

(1) Each officer or employee of the carrier who performs supervisory duties related to the transportation of hazardous materials; and

(2) Each person who operates or who is in charge of a motor vehicle containing hazardous materials.

(b) Each person designated in paragraph (a) of this section must know and obey the rules in this part.

(c) Intracity operations: The rules in this part do not apply to a driver or a vehicle wholly engaged in exempt intracity operations as defined in §390.16, of this chapter.

§ 397.2 Compliance with Federal motor carrier safety regulations. A motor carrier or other person to whom this part is applicable must comply with the rules in Part 390 through 397, inclusive, of this subchapter when he is transporting hazardous materials by a motor vehicle which must be marked or placarded in accordance with § 177.823 of this title.

§ 397.3 State and local laws, ordinances, and regulations. Every motor vehicle containing hazardous materials must be driven and parked in compliance with the laws, ordinances, and regulations of the jurisdiction in which it is being operated, unless they are at variance with specific regulations of the Department of Transportation which are applicable to the operation of that vehicle and which impose a more stringent obligation or restraint.

§ 397.5 Attendance and surveillance of motor vehicles. (a) Except as provided in paragraph (b) of this section, a motor vehicle which contains Class A or Class B explosives must be attended at all times by its driver or a qualified representative of the motor carrier that operates it.

(b) The rules in paragraph (a) of this section do not apply to a motor vehicle which contains Class A or Class B explosives if all the following conditions exist—

(1) The vehicle is located on the property of a motor carrier, on the property of a shipper or consignee of the explosives, in a safe haven, or, in the case of a vehicle containing 50 pounds or less of either Class A or Class B explosives, on a construction or survey site; and

(2) The lawful bailee of the explosives is aware of the nature of the explosives the vehicle contains and has been instructed in the procedures he must follow in emergencies; and

(3) The vehicle is within the bailee's unobstructed field of view, or is located in a safe haven.

(c) A motor vehicle which contains hazardous materials other than Class A or Class B explosives and which is located on a public street or highway or the shoulder of a public highway must be attended by its driver. However, the vehicle need not be attended while its driver is performing duties which are incident and necessary to his duties as the operator of the vehicle.

(d) For purposes of this section—

(1) A motor vehicle is attended when the person in charge of the vehicle is on the vehicle, awake, and not in a sleeper berth, or is within 100 feet of the vehicle and has it within his unobstructed field of view.

(2) A qualified representative of a motor carrier is a person who—

(i) Has been designated by the carrier to attend the vehicle;

(ii) Is aware of the nature of the hazardous materials contained in the vehicle he attends;

(iii) Has been instructed on the procedures he must follow in emergencies; and

(iv) Is authorized to move the vehicle and has the means and ability to do so.

(3) A safe haven is an area specifically approved in writing by local, State, or Federal governmental authorities for the parking of unattended vehicles containing Class A or Class B explosives.

(e) The rules in this section do not relieve a driver from any obligation imposed by law relating to the placing of warning devices when a motor vehicle is stopped on a public street or highway.

§ 397.7 Parking. (a) A motor vehicle which contains Class A or Class B explosives must not be parked under any of the following circumstances—

(1) On or within 5 feet of the traveled portion of a public street or highway;

(2) On private property (including premises of a fueling or eating facility) without the knowledge and consent of the person who is in charge of the property and who is aware of the nature of the hazardous materials the vehicle contains; or

(3) Within 300 feet of a bridge, tunnel, dwelling, building, or place where people work, congregate, or assemble, except for brief periods when the necessities of operation require the vehicle to be parked and make it impracticable to park the vehicle in any other place.

(b) A motor vehicle which contains hazardous materials other than Class A or Class B explosives must not be parked on or within five feet of the traveled portion of public street or highway except for brief periods when the necessities of operation require the vehicle to be parked and make it impracticable to park the vehicle in any other place.

§ 397.9 Routes. (a) Unless there is no practicable alternative, a motor vehicle which contains hazardous materials must be operated over routes which do not go through or near heavily populated areas, places where crowds are assembled, tunnels, narrow streets, or alleys. Operating convenience is not a basis for determining whether it is practicable to operate a motor vehicle in accordance with this paragraph.

(b) Before a motor carrier requires or permits a motor vehicle containing Class A or Class B explosives to be operated, he must prepare a written plan of a route that complies with the rules in paragraph (a) of this section for that vehicle and must furnish a copy of the written plan to the vehicle's driver. However, the driver may prepare the written plan as agent for the motor carrier when the driver begins his trip at a location other than the carrier's terminal.

§ 397.11 Fires. (a) A motor vehicle containing hazardous materials must not be operated near an open fire unless its driver has first taken precautions to ascertain that the vehicle can safely pass the fire without stopping.

(b) A motor vehicle containing hazardous materials must not be parked within 300 feet of an open fire.

§ 397.13 Smoking. No person may smoke or carry a lighted cigarette, cigar, or pipe on or within 25 feet of—

(a) A motor vehicle which contains explosives, oxidizing materials, or flammable materials; or

(b) An empty tank motor vehicle which has been used to transport flammable liquids or gases and which, when so used, was required to be marked or placarded in accordance with the rules in §177.823 of this title.

§ 397.15 Fueling. When a motor vehicle which contains hazardous materials is being fueled—

(a) Its engine must not be operating; and

(b) A person must be in control of the fueling process at the point where the fuel tank is filled.

§ 397.17 Tires. (a) If a motor vehicle which contains hazardous materials is equipped with dual tires on any axle, its driver must stop the vehicle in a safe location at least once during each 2 hours or 100 miles of travel, whichever is less, and must examine its tires. The driver must also examine the vehicle's tires at the beginning of each trip and each time the vehicle is parked.

(b) If, as the result of an examination pursuant to paragraph (a) of this section, or otherwise, a tire if found to be flat, leaking, or improperly inflated, the driver must cause the tire to be repaired, replaced, or properly inflated before the vehicle is driven. However, the vehicle may be driven to the nearest safe place to perform the required repair, replacement, or inflation.

(c) If, as the result of an examination pursuant to paragraph (a) of this section, or otherwise, a tire is found to be overheated, the driver shall immediately cause the overheated tire to be removed and placed at a safe distance from the vehicle. The driver shall not operate the vehicle until the cause of the overheating is corrected.

(d) Compliance with the rules in this section does not relieve a driver from the duty to comply with the rules in §§397.5 and 397.7.

§ 397.19 Instructions and documents. (a) A motor carrier that transports Class A or Class B explosives must furnish the driver of each motor vehicle in which the explosives are transported with the following documents:

(1) A copy of the rules in this part;

(3) A document containing instructions on procedures to be followed in the event of accident or delay. The documents must include the names and telephone numbers of persons (including representatives of carriers or shippers) to be contacted, the nature of the explosives being transported, and the precautions to be taken in emergencies such as fires, accidents, or leakages.

(b) A driver who receives documents in accordance with paragraph (a) of this section must sign a receipt for them. The carrier shall retain the receipt in his files for 1 year at his principal place of business. However,

upon a written request to, and with the approval of, the Director, Regional Motor Carrier Safety Office, for the region in which a motor carrier has his principal place of business, the carrier may maintain the receipts at a regional or terminal office. The addresses and jurisdictions of the Directors of Regional Motor Carrier Safety Offices are shown in § 390.40 of this subchapter.

(c) A driver of a motor vehicle which contains Class A or Class B explosives must be in possession of, be familiar with, and be in compliance with—

(1) The documents specified in paragraph (a) of this section;
(2) The documents specified in § 177.817 of Chapter I of this title; and
(3) The written route plan specified in § 397.9(b).

§ 397.21 Marking of vehicles operated by private carriers.

(a) *General.* A motor vehicle being operated by a private carrier of property must be marked as specified in paragraphs (b) and (c) of this section if that vehicle—

(1) Is transporting hazardous materials of a kind or quantity that require the vehicle to be marked or placarded in accordance with § 177.823 of this title; and

(2) Is operating under its own power, either alone or in combination.

(b) *Nature of marking.* The marking must display the following information:

(1) The name or trade name of the private carrier operating the vehicle.

(2) The city or community in which the carrier maintains its principal office or in which the vehicle is customarily based.

(3) If the name of a person other than the operating carrier appears on the vehicle, the words "operated by" immediately preceding the information required by subparagraphs (1) and (2) of this paragraph.

Other identifying information may be displayed on the vehicle if it is not inconsistent with the information required by this paragraph.

(c) *Size, shape, location, and color of marking.* The material must—

(1) Appear on both sides of the vehicle;
(2) Be in letters that contrast sharply in color with the background;
(3) Be readily legible during daylight hours from a distance of 50 feet while the vehicle is stationary; and
(4) Be kept and maintained in a manner that retains the legibility required by subparagraph (3) of this paragraph.

The marking may consist of a removable device if that device meets the identification and legibility requirements of this section.

PART 146

TRANSPORTATION OR STORAGE

OF MILITARY

EXPLOSIVES ON BOARD VESSELS

PART 146—
TRANSPORTATION OR STORAGE OF MILITARY EXPLOSIVES ON BOARD VESSELS

SUBPART 146.01

PREFACE

§ 146.01-1 *Purpose of regulations.* The purpose of the regulations in this subchapter is to promote safety in the handling, stowage, storage and transportation of military explosives as defined herein, on board vessels on any navigable waters within the limits of the jurisdiction of the United States including its territories and possessions excepting only the Panama Canal Zone and to make more effective the provisions of the International Convention for the Safety of Life at Sea, 1960, relative to the carriage of dangerous goods.

§ 146.01-2 [Removed]

§ 146.01-3 *Plan of regulations.* This part prescribes the requirements of the Department of Transportation governing the transportation of military explosives on board vessels. Regulations governing the transportation of other hazardous materials in packages on board vessels are in 49 CFR Parts 171-189.

§ § 146.01-4 through 146.01-13 [Removed]

SUBPART 146.02

GENERAL REGULATIONS

§ 146.02-1 *Scope of regulations.* The regulations in this part:
(a) Set forth the requirements that shall be observed in the preparation and packing of military explosives for shipment or storage on board vessels;
(b) Set forth the descriptive name, shipping name, requirements relative to certification, containers, marking, labeling, information required on bills of lading or other shipping papers, manifests or cargo stowage plans for shipments of military explosives on board vessels;
(c) Set forth the provisions under which permitted military explosives within the scope of the definitions given herein, may be accepted, handled, stored, stowed, or transported on board vessels, and with respect to rejection and report of faulty containers and the disposition of any military explosives found to be in an unsafe condition when on board a vessel;
(d) Establish such other requirements as may be necessary to make effective the safe transportation of military explosives on board vessels.

§ 146.02-2 *Application to vessels.* (a) Except as provided in paragraph (b) of this section, this part applies to each domestic or foreign vessel when in the navigable waters of the United States, regardless of its character, tonnage, size, or service, and whether self-propelled or not, whether arriving or departing, underway, moored, anchored, aground, or while in dry dock.
(b) This part does not apply to:
(1) A public vessel not engaged in commercial service;
(2) A vessel constructed or converted for the principal purpose of carrying flammable or combustible liquid cargo in bulk in its own tanks, when only carrying these liquid cargoes;
(3) A vessel of 15 gross tons or smaller when not engaged in carrying passengers for hire;
(4) A vessel used exclusively for pleasure;
(5) A vessel of 500 gross tons or smaller when engaged in fisheries;
(6) A tug or towing vessel except when towing another vessel having explosives, flammable liquids or flammable compressed gas on board on deck in which case the tug or towing vessel shall make such provisions to guard against and extinguish fire as the Coast Guard may prescribe; or
(7) A cable vessel, dredge, elevator vessel fireboat, icebreaker, pile driver, pilot boat, welding vessel, salvage vessel, or wrecking vessel.

§ 146.02-3, 146.02-4 [Removed]

§ 146.02-5 *Responsibility for compliance.* Unless this part specifically provides that another person must perform a duty, each carrier, including a connecting carrier, shall comply with all applicable regulations in this part, and shall thoroughly instruct his employees in relation thereto.

§ 146.02-6 *Enforcement.* (a) An enforcement officer of the U.S. Coast Guard may at any time and at any place, within the jurisdiction of the United States, board any vessel for the purpose of enforcement of this part.
(b) Under the authority of 46 U.S. Code 170(13) and in the manner provided therein, a collector of customs may detain a vessel which is in violation of this part.

§ 146.02-6a *Assignment and certification.* (a) The National Cargo Bureau, Inc., is authorized to assist the Coast Guard in administering this part with respect to the following:
(1) Inspection of vessels for suitability for loading military explosives;
(2) Examination of stowage of military explosives;
(3) Making recommendations for stowage requirements of military explosives; and
(4) Issuance of certificates of loading setting forth that the stowage of military explosives is in accordance with the requirements of 46 U.S.C. 170 and this part.
(b) A certificate of loading issued by the National Cargo Bureau, Inc., may be accepted by the Coast Guard as prima facie evidence that the cargo is stowed in conformity with the requirements of 46 U.S.C. 170 and this part.

§ § 146.02-7 through 146.02-11 [Removed]

§ 146.02-12 *Inspection of cargo.* (a) *Manned vessels.* (1) The master of a vessel transporting military explosives shall cause an inspection of each hold or compartment containing military explosives to be made after stowage is complete, and at least once every 24 hours thereafter, weather permitting, in order to ensure that the cargo is in a safe condition and that no damage caused by shifting, spontaneous heating, leaking, sifting, wetting, or other cause has been sustained by the vessel or its cargo since loading and stowage. This requirement does not require freight containers or individual barges to be opened. A vessel's holds equipped with smoke or fire detecting systems, having an automatic monitoring capability, need not be inspected except after stowage is complete and after periods of heavy weather.
(2) The master shall cause an entry to be made in the vessel's deck log book for each inspection of the stowage of military explosives performed.
(b) *Unmanned and magazine vessels.* An inspection of the cargo must be made after stowage has been completed to ensure that stowage has been accomplished properly and that there are no visible signs of damage to any packages or evidence of heating, leaking, or sifting. This inspection must be made by the individual who is responsible to the carrier and who is in charge of loading and stowing the cargo on the unmanned vessels or the individual in charge in the case of a magazine vessel.
(c) The master of each ocean-going vessel carrying military explosives shall, immediately prior to entering a port in the United States, cause an inspection of that cargo to be made.
(d) When inspecting a cargo of military explosives capable of evolving flammable vapors, any artificial means of illumination must be of an explosion-proof type.

For explanation of abbreviations and reference marks, see last page of this tariff.

§ 146.02-14 Acceptance of damaged or leaking packages. A carrier may not transport by vessel any package that is so damaged as to permit the escape of its contents, that appears to have leaked, or that gives evidence of failure to properly contain the contents unless it is restored or repaired to the satisfaction of the master of the vessel.

§ 146.02-15 Emergency situations. (a) When an accident occurs on board a vessel involving military explosives, and the safety of the vessel, its passengers or crew are endangered, the master shall adopt such procedures as will, in his judgment, provide maximum safety for the vessel and its crew. When the accident results in damaged packages or the emergency use of unauthorized packagings, these packages may not be offered to any forwarding carrier for transportation. The master shall notify the nearest District Commander, U.S. Coast Guard, and request instructions for disposition of the packages.

(b) Military explosives may be jettisoned only if the master believes this action necessary to prevent or substantially reduce a hazard to human life or reduce a substantial hazard to property.

§ 146.02-16 Rejections of shipments in violation. (a) A carrier may not knowingly transport by vessel any military explosive offered under a false or deceptive name, marking, invoice, shipping paper or other declaration, or without the shipper furnishing written information about the true nature of the material at the time of delivery.

(b) If a shipment in violation is found in transit, the master of the vessel shall adopt procedures which in his judgment provide maximum safety to the vessel, its passengers and its crew and which are in compliance with § 146.02-15. If the vessel is in port, the material may not be delivered to any party, and the master shall immediately notify the nearest District Commander and request instructions for disposition of the material.

§ §146.02-17 through 146.02-19 [Removed]

§ 146.02-20 Repairs involving welding or burning. (a) Except as provided in paragraph (b) of this section, repairs or work involving welding or burning, or the use of power-actuated tools or appliances which may produce intense heat may not be undertaken on any vessel having military explosives on board as cargo.

(b) Paragraph (a) of this section does not apply if the repairs or work are approved by the local Coast Guard Captain of the Port or his authorized representative.

§ 146.02-21 [Removed]

§ 146.02-22 Preservation of records. (a) When this part requires shipping orders, manifest, cargo lists, stowage plans, reports, or any other papers, documents or similar records to be prepared, the carrier shall preserve them or copies of them in his place of business or office in the United States for a period of one year after their preparation.

(b) Any record required to be preserved must be made available upon request to an authorized representative of the U.S. Coast Guard.

§ 146.02-25 Exemptions and Alternative Stowage Procedures. (a) Procedures whereby persons subject to the requirements of this part may obtain administrative relief therefrom on the basis of equivalent levels of safety or levels of safety consistent with the public interest are set forth in 49 CFR Part 107, Subpart B.

(b) When a military explosive is to be loaded on board a vessel and it is shown to the satisfaction of the Captain of the Port for the place where the vessel is being loaded that it is impracticable to comply with a stowage location, handling, or stowage requirement prescribed in this part, the Captain of the Port may authorize in writing the use of an alternative stowage location or method of handling or stowage subject to such conditions as he finds will ensure a level of safety at least equivalent to that afforded by the regulatory requirement concerned.

§ 146.02-30 [Removed]

§ 146.02-35 Situation requiring report. (a) When a fire or other hazardous condition exists on a vessel transporting military explosives, the master shall notify the nearest District Commander as soon as possible and shall comply with any instructions given by the District Commander.

(b) When an incident occurs during transportation in which military explosives are involved, Hazardous Materials Incident Reports may be required. See 49 CFR 171.15 and 171.16.

(c) If a package, container, portable tank, highway or railroad vehicle containing military explosives is jettisoned or lost, the master shall notify the nearest District Commander as soon as possible of the location, quantity, and type of explosives.

SUBPARTS 146.03 AND 146.04

[REMOVED]

SUBPART 146.05

SHIPPER'S REQUIREMENTS REGARDING PACKING, MARKING, LABELING AND SHIPPING PAPERS

§ 146.05-1 General requirements. (a) No person may offer military explosives for transportation on board a vessel unless they are properly classed, described, packaged, marked, labeled, and in the condition for shipment required by this part.

(b) A shipment of military explosives that is not prepared for shipment in accordance with this part may not be offered for transportation on board a vessel. It is the duty of each person who offers military explosives for transportation to instruct each of his officers, agents, and employees having any responsibility for preparing military explosives for shipment as to applicable regulations in this part.

(c) Methods of container manufacture, packing, and storage, that affect safety in transportation, must be open to inspection by a duly authorized representative of the initial carrier or a representative of the U.S. Coast Guard.

§ 146.05-2 [Removed]

§ 146.05-3 Prohibited packaging. (a) No person may offer for transportation on board a vessel any military explosives in an outside packaging which also contains any substance likely to cause a dangerous evolution of heat or gas or produce corrosive materials.

(b) No person may offer for transportation on board a vessel any military explosives which under conditions normally incident to transportation may polymerize (combines or react with itself) or decompose so as to cause dangerous evolution of heat or gas, unless they are properly stabilized or inhibited. Refrigeration may be used as a means of stabilization only when approved by the Commandant (GMHM).

§ §146.05-4 through 146.05-10a [Removed]

§ 146.05-11 Shipper's certification. Each person who offers military explosives for transportation on board a vessel shall certify in writing that the explosives are being presented for transportation in accordance with this part by printing (manually or mechanically) the following statement on the shipping paper containing the required shipping description:

This is to certify that the above-named materials are properly classified, described, packaged, marked and labeled and are in proper condition for transportation according to the applicable regulations of the Department of Transportation.

Note.—Preprinted certificates complying with 49 CFR 173.430(a) in effect on June 30, 1978, may be used through June 30, 1979. After June 30, 1979, use of the certificate required by this section is mandatory.

§ 146.05-12 Shipping papers. (a) A carrier may not transport military explosives on board a vessel unless the explosives are properly described on the shipping papers in the manner prescribed in 49 CFR, Part 172, Subpart C.

(b) A carrier may not transport military explosives on board a vessel unless it has been certified by the shipper in accordance with § 146.05-11.

§ § 146.05-13, 146.05-14 [Removed]

§ 146.05-15 Marking and labeling. Each package of military explosives offered for transportation on board a vessel must be marked and labeled in accordance with 49 CFR, Part 172, Subparts D and E respectively.

§ § 146.05-16, 146.05-17 [Removed]

SUBPARTS 146.06, 146.07, AND 146.08

[REMOVED]

SUBPART 146.09

CARGO HANDLING AND STOWAGE DEVICES

§ § 146.09-1 through 146.09-6 [Removed]

§ 146.09-7 Specifications of moisture proofed paper bags.

SPECIFICATION MIN-W10

MOISTURE PROOFED MULTIWALL PAPER BAGS FOR TRANSPORTATION OF QUICKLIME BY WATER

GENERAL

1. **Compliance.** Containers must comply with, or may exceed, details of the specifications.
2. **Capacity.** Not over 100 pounds net.

MATERIAL

3. **Paper.** Kraft (100% sulfate) paper.
4. **Moisture proofing.** Asphalt or other material equal or superior to asphalt.

CONSTRUCTION

5. **(a) Description.** A multiwall paper bag constructed of not less than four plies, one or more of which will be moisture proofed.

(b) Assembly of moisture proofed ply. The assembly of the moisture proofed ply will be accomplished by combining two sheets of Kraft (100% sulfate) paper having a basis weight of not less than 20 pounds each with not less than 25 pounds of asphalt applied evenly to the paper surface.

(c) Alternate moisture proofed ply. Any other moisture proofed Kraft paper of a total basis weight of not less than 40 pounds before treatment, whose moisture proofed qualities are equal or superior to the above asphalt treated paper as determined by the Thwing Vapometer test for moisture-vapor transmission.

(d) Additional plies. Remaining plies of the bag will be constructed of Kraft (100%) sulfate paper, each sheet having a basis weight of not less than 40 pounds, and a Kady or Mullen test of 40 pounds per square inch. The combined weight of said remaining plies to be not less than the weights given in the following table:

Approximate weight of contents:	*Combined weight of remaining plies in addition to moisture proofed ply described in (5)(b)*
To and including 50 pounds	130 pounds
51 pounds to and including 80 pounds	150 pounds
81 pounds to and including 100 pounds	170 pounds

All weights given are on the basis of 480 (24 x 36 inch) sheets.

(e) Longitudinal seams. Longitudinal seams made by lapping not less than one inch and pasting.

(f) Bottom closure. Bottom closure made by folding and interlapping and pasting; or taped sewed and dipped in a waterproofing compound; *or sewed and taped over stitching.*

(g) Top closure. By wire ties consisting of not less than two No. 16 Birmingham wire gauge or heavier wires; or by valve mouth with top of bag folded and interlapped and pasted; or by valve mouth with top of bag taped, sewed and dipped in waterproofing compound; *or sewed and taped over stitching.*

6. **Test.** The finished container, filled and closed, must be capable of withstanding a drop test of 4 feet on the butt without sifting or rupture of any ply.

MARKING

7. **In each container.** By marks at least one inch high as follows:

(a) Min-W10. This marking shall be understood to certify that the container complies with all specification requirements.

(b) Name and address of maker located above or below the mark specified in (7)(a).

§ 146.09-8 Specifications of moisture proofed paper lined burlap bags.

SPECIFICATION MIN-W11

MOISTURE PROOFED PAPER LINED BURLAP BAGS FOR TRANSPORTATION OF QUICKLIME BY WATER

GENERAL

1. **Compliance.** Containers must comply with, or may exceed, details of the specifications.
2. **Capacity.** Not over 100 pounds net.

MATERIAL

3. **Burlap.** At least equal in quality and strength to 7½ ounce 40 inch (7½/40) Calcutta common burlap. Thread count at least 9 per inch warp and 9 per inch fillet.
4. **Paper.** No. 1 Kraft creped. Finished weight of 40 pounds per ream (480 sheets 24 x 36 inch) after creping.

CONSTRUCTION

5. **(a) Description.** Burlap bag lined with a water proofed paper lining.

(b) Assembly of moisture proofed lining. The assembly of the moisture proofed lining will be accomplished by combining two plies of creped paper having a finished weight of not less than 40 pounds each, evenly coated between the two plies with asphalt of any desirable type, of minimum 150° F. melting point, over the entire area of paper, with minimum coverage of 110 pounds per ream.

(c) Assembly of moisture proofed ply and burlap. The burlap will be lined with the moisture proofed creped paper by cementing together with a suitable latex compounded adhesive to securely attach paper lining to the burlap.

(d) Stretch of paper lining. After they are cemented to the burlap the stretch of the paper lining must equal the stretch of the burlap in the direction of the warp and filling and equal to 10 percent in a diagonal direction.

(e) Seams. Bags must be made with cemented center seams and taped bottoms to make them sift proof and airtight and to provide strength at least equal to the bag material.

(f) Closure. Bags to be wire tied with two No. 16 Birmingham wire gauge or heavier wire ties.

6. **Test.** The finished container, filled and closed, must be capable of withstanding a drop test of 4 feet on the butt without sifting or rupture of any ply.

MARKING

7. **On each container.** By marks at least 1 inch high as follows:

(a) MIN-W11. This marking shall be understood to certify that the container complies with all specification requirements.
(b) Name and address of maker located above or below the mark specified in (7)(a).

§ 146.09-11 Requirements of equipment for handling explosives. (a) A chute for loading and unloading explosives must be constructed of smooth planed boards not less than one-inch thick with side guards of the same material at least 4 inches high. Only brass screws may be used to assemble the sides and bottom. D-shaped wooden strips or runners not more than six inches apart and running the length of the chute must be fastened to the upper surface of the slide by glue and wooden dowels extended through the bottom of the chute. Four lashing rings must be provided, one at each outside corner of the chute, for purposes of securing during use.
(b) A roller conveyor constructed of aluminum or other non-sparking material may be used for loading or unloading explosives. The conveyor must be grounded when in use.
(c) A powered conveyor may be used only after the design, construction, and specifications have been approved by the Commandant (GMHM).

§ 146.09-12 [Removed]

§ 146.09-15 Use of power-operated industrial trucks on board vessels. (a) A power-operated truck (including a power-operated tractor, forklift, or other specialized truck used for cargo handling) may not be used on board a vessel in a space containing military explosives unless the truck complies with the requirements of this section.
(b) Each truck must have a specific designation of Underwriter's Laboratories or Factory Mutual Laboratories. Any repair or alteration to a truck must be equivalent to that required on the original designation.
(c) Description of designations. The recognized testing laboratory type designations are as follows:
(1) An "E" designated unit is an electrically-powered unit that has minimum acceptable safeguards against inherent fire hazards.
(2) An "EE" designated unit is an electrically-powered unit that has, in addition to all the requirements for the "E" unit, the electric motor and all other electrical equipment completely enclosed.
(3) An "EX" designated unit is an electrically-powered unit that differs from the "E" and "EE" units in that the electrical fittings and equipment are so designed, constructed, and assembled that the unit may be used in certain atmospheres containing flammable vapors or dusts.
(4) A "G" designated unit is a gasoline-powered unit having minimum acceptable safeguards against inherent fire hazards.
(5) A "GS" designated unit is a gasoline-powered unit that is provided with additional safeguards to the exhaust, fuel, and electrical systems.
(6) An "LP" designated unit is similar to a "G" unit except that it is powered by liquified petroleum gas instead of gasoline.
(7) An "LPS" designated unit is a unit similar to a "GS" unit except that liquefied petroleum gas is used for fuel instead of gasoline.
(8) A "D" designated unit is a unit similar to a "G" unit except that it is powered by a diesel engine instead of a gasoline engine.
(9) A "DS" designated unit is a unit powered by a diesel engine provided with additional safeguards to the exhaust, fuel, and electrical systems.
(d) Explosives. A truck may not be used in a hold or compartment containing explosives unless its use is approved by the Commandant (GMHM). In a space in which packaged small arms ammunition without explosive bullets is stowed, an approved power-operated industrial truck (except "E", "G", or "LP") may not be used unless its use is approved by the Captain of the Port when the truck is to be so used.
(e) [Reserved]
(f) Minimum safety features. In addition to the construction and design safety features required, each truck must have at least the following minimum safety features:
(1) The truck must be equipped with a warning horn, whistle, gong, or other device that may be heard clearly above normal shipboard noises.
(2) When the truck operation may expose the operator to danger from a falling object, the truck must be equipped with a driver's overhead guard, when the overall height of the truck with forks in the lowered position is limited by head room the overhead guard may be omitted. This overhead guard is only intended to offer protection from impact of small packages, boxes, bagged material, or similar hazards.
(3) A fork lift truck which handles small objects or unstable loads must be equipped with a load backrest extension having height, width, and strength sufficient to prevent any load, or part of it, from falling toward the mast is in a position of maximum backward tilt. It must be constructed in a manner that does not interfere with good visibility.
(4) The forks on a fork lift truck must be secured to the carriage so as to prevent any unintentional lifting of the toe which could create a hazard. The forks may not display permanent deformation when subjected to a test load of three times the rated capacity.
(5) Each fork extension or other attachment must be secured to prevent unintentional lifting or displacement on primary forks.
(6) Tires extending beyond the confines of the truck shall be provided with a guard to prevent the tires from throwing particles at the operator.
(7) Unless the steering mechanism is a type that prevents road reactions from causing the steering handwheel to spin, a mushroom type steering knob must be used to engage the palm of the operator's hand, or the steering mechanism must be arranged in some other manner to prevent injury. The knob must be mounted within the perimeter of the wheel.
(8) All steering controls must be confined within the clearance of the truck or guarded so that movement of the controls will not result in injury to the operator when passing stanchions, obstructions or other.
(g) Special operating conditions. (1) A truck may not be used on board a vessel unless prior notification of its use is given to the master or senior deck officer on board.
(2) Before a truck is operated on board a vessel, it must be in a safe operating condition as determined by the master or senior deck officer on board.
(3) Any truck that emits sparks or flames from the exhaust system must immediately be removed from service and may not be returned to service until the cause of these sparks or flames has been eliminated.
(4) A truck may not be operated on board a vessel when the temperature of any part of the truck is found to be in excess of a safe operating temperature.
(5) All truck motors must be shut off immediately when an emergency condition arises on board a vessel.
(6) All truck motors must be shut off immediately when a breakage or leakage of packages containing flammable liquids or gases, flammable solids, oxidizers, or organic peroxides occurs or is discovered.
(7) The rated capacity of the truck must be posted on the truck at all times in a conspicuous place. This capacity may not be exceeded.
(8) At least one Coast Guard approved marine type size 1 Type B, or UL approved 5BC portable fire extinguisher, or its approved equivalent, must be affixed to the truck in a readily accessible position or must be kept in close proximity, available for immediate use.
(9) The vessel's fire fighting equipment, both fixed (where installed) and portable, must be kept ready for immediate use in the vicinity of the space being worked.
(h) Refueling. (1) A truck using gasoline as fuel may not be refueled in the hold or on the weather deck of a vessel unless a portable non-spilling fuel handling system of not over five gallons capacity is used. Gasoline may not be transferred to a portable non-spilling fuel handling device on board the vessel.
(2) A truck using liquefied petroleum gas as fuel may not be refueled in the hold or on the weather deck of a vessel unless it is fitted with a removable tank and the hand-operated shutoff valve of the depleted tank is closed. In addition, the motor must be run until it stalls from lack of fuel and then the hand-operated shutoff valve closed before the quick disconnect fitting to the fuel tank is disconnected.
(3) A truck using diesel oil as fuel may not be refueled on the weather deck or in the hold of a vessel unless a portable container of not over a five gallon capacity is used. A truck may be refueled or a portable container may be refilled from a larger container of diesel fuel on the weather deck of a vessel if a suitable pump is used for the transfer operation and a drip pan of adequate size is used to prevent any dripping of fuel on the deck.
(4) Refueling must be performed under the direct supervision of an experienced and responsible person specifically designated for this duty by the person in charge of the loading or unloading of the vessel.
(5) Refueling may not be undertaken with less than two persons specifically assigned and present for the complete operation, at least one of whom must be experienced in using the portable fire extinguishers required in the fuel area.
(6) At least one Coast Guard approved marine type size 1 Type B or UL approved 5BC portable fire extinguisher or its approved equivalent, must be provided in the fueling area. This is an addition to the extinguisher required by paragraph (g)(8) of this section.
(7) The location for refueling trucks must be designated by the master or senior deck officer on board the vessel. "NO SMOKING" signs must be conspicuously posted in the area.
(8) The location designated for refueling must be adequately ventilated to insure against accumulation of any hazardous concentration of vapors. When a truck is being refueled, the ventilation requirements of §146.09-16 apply.
(9) Before any truck in a hold is refueled or before any fuel handling device or unmounted liquefied petroleum gas cylinder is placed in a hold, the motors of all trucks in the same hold must be stopped.
(10) All fuel handling devices and unmounted liquefied petroleum gas containers must be removed from a hold before any truck motor is started and the trucks are placed in operation in that hold.
(i) Replacing batteries. Batteries for electrically powered trucks and for the ignition systems of internal combustion powered trucks may be changed in the hold of a vessel subject to the following conditions:
(1) Only suitable handling equipment may be employed.
(2) Adequate precautions must be taken to avoid damage to the battery, short circuiting of the battery, and spillage of the electrolyte.
(j) Charging of batteries. Batteries of industrial trucks may be recharged in a hold of a vessel subject to the following conditions:
(1) The batteries must be housed in a suitable, ventilated, portable metal container with a suitable outlet at the top for connection of a portable air hose, or must be placed directly beneath a suitable outlet at

the top for connection of a portable air hose. The air hose must be permanently connected to an exhaust duct leading to the open deck and terminate in a gooseneck or other suitable weather head. If natural ventilation is not practicable or adequate, mechanical means of exhaust must be employed in conjunction with the duct. The air outlet on the battery container must be equipped with an interlock switch so arranged that the charging of the battery cannot take place unless the air hose is properly connected to the box.

(2) If mechanical ventilation is used, an additional interlock must be provided between the fan and the charging circuit so that the fan must be in operation in order to complete the charging circuit for operation. It is preferable that this interlock switch be of a centrifugal type driven by the fan shaft.

(3) The hold may not contain any hazardous materials.

(4) The charging facilities may be part of the truck equipment or may be separate from the truck and located inside or outside the cargo hold. The power supply or charging circuit (whichever method is used) must be connected to the truck by a portable plug connection of the breakaway type. This portable plug must be so engaged with the truck battery charging outlet that any movement of the truck away from the charging station will break the connection between the plug and receptacle without exposing any live parts to contact with a conducting surface or object and without the plug falling to the deck where it may become subject to damage.

(5) All unmounted batteries must be suitably protected or removed from an area in the hold of the vessel before any truck is operated in that area.

(k) **Stowage of power-operated industrial trucks on board a vessel.** (1) Trucks may be stowed in any location on board a vessel subject to the following conditions:

(i) Each gasoline-powered truck must have all the fuel expended from the fuel system.

(ii) Each liquefied petroleum gas-operated truck must have the fuel tank removed and all the fuel expended from the fuel system.

(2) Any truck not meeting the conditions set forth in paragraph (k)(1) of this section must be stowed on the open deck except for intervals such as lunch hours, between work shifts, and interdock and intraport movements. If a truck is stowed in a fixed metal enclosure located on or above the weather deck, this enclosure must have access from the weather deck only and must have adequate ventilation arranged to remove vapors from both the upper and lower portions of the space.

(l) **Packaging and stowage of fuel on board a vessel.** (1) Packaging. Flammable liquids and gases to be used as fuels for trucks must be packaged in DOT specification containers, A.S.M.E. containers, or portable safety containers approved by a recognized testing laboratory and authorized for the contents.

(2) Marking and labeling. The appropriate DOT label must be affixed to each container of flammable liquid or flammable gas.

(3) Stowage. Each container must be stowed on or above the weather deck as designated by the master. However, a DOT specification container, A.S.M.E. container, or portable safety container having a capacity of five gallons or less and approved by a recognized testing laboratory may be stowed below deck in a paint locker and diesel fuel may be stowed in any location designated by the master.

§ 146.09-15 Spaces exposed to carbon monoxide or other hazardous vapors. When military explosives are transported by vessel in an enclosed space which is exposed to carbon monoxide or other hazardous vapors from exhausts of power-operated industrial trucks or other mechanized equipment, the space must be provided with adequate ventilation to prevent the accumulation of dangerous vapors. The senior deck officer shall insure that a test of the carbon monoxide content of the atmosphere is made as frequently as conditions require to detect the presence of any dangerous concentration of vapors in areas where persons may be working. The test must be made by a person acquainted with the test equipment and procedure. The carbon monoxide concentration in any hold or intermediate deck where any person is working may not exceed 50 parts per million (0.005 percent) as a time weighted average. Persons may not be permitted to remain in any hold or intermediate deck where the concentration exceeds 75 parts per million (0.0075 percent). Portable blowers of adequate size and location may be used to remove any vapors not removed by installed ventilation systems.

SUBPARTS 146.10 AND 146.19 [REMOVED]

SUBPART 146.20

DETAILED REGULATIONS GOVERNING EXPLOSIVES

§ 146.20-1 An explosive. For the purpose of the regulations in this subchapter an explosive is defined as any chemical compound, mixture, or device, the primary or common purpose of which is to function by explosion, i.e., with substantially instantaneous release of gas and heat, unless such compound, mixture, or device is otherwise specifically classified in the regulations in this part.

§ 146.20-3 Prohibited or not permitted explosives. The offering of the following explosives for transportation, carriage, conveyance, storage, stowage, or use on board vessels is forbidden:

(a) Fulminates or other detonating compounds in bulk in dry condition.

(b) Explosive compositions that ignite spontaneously or undergo marked decomposition when subjected for 48 consecutive hours to a temperature of 75° C. (167° F).

(c) Explosives containing an ammonium salt and a chlorate.

(d) Liquid nitroglycerin, diethylene glycol dinitrate, or other liquid explosives not authorized by the Commandant of the Coast Guard.

(e) Explosives condemned by the Department of Transportation (except properly packed samples for laboratory examinations). Appeal may be made to the Department of Transportation from such condemnations.

(f) Leaking or damaged packages of explosives.

(g) Condemned or leaking dynamite shall not be repacked and offered for shipment unless written authority is granted by the Department of Transportation and the repacking is done by a competent person in the presence of an inspector designated by the Department of Transportation.

(h) Firecrackers, flash crackers, salutes, or similar commercial devices which produce or are intended to produce an audible effect, the explosive content of which exceeds 12 grains each in weight, and pest control bombs, the explosive content of which exceeds 18 grains in weight; and any such devices, without respect to explosive content, which on functioning are liable to project or disperse metal, glass or brittle plastic fragments.

(i) Fireworks that combine an explosive and a detonator or blasting cap.

(j) Fireworks containing an ammonium salt and a chlorate.

(k) Fireworks containing yellow or white phosphorus.

(l) Fireworks or fireworks compositions that ignite spontaneously or undergo marked decomposition when subjected for 48 consecutive hours to a temperature of 75° C. (167° F).

(m) Fireworks condemned by the Department of Transportation except properly repacked samples for laboratory examinations.

(n) Toy torpedoes, the maximum outside dimension of which exceeds ⅞ inch, or toy torpedoes containing a mixture of potassium chlorate, black antimony and sulfur with an average weight of explosive composition in each torpedo exceeding 4 grains.

(o) Toy torpedoes containing a cap composed of a mixture of red phosphorus and potassium chlorate exceeding an average of one-half (0.5) grain per cap.

(p) Fireworks containing copper sulfate and a chlorate.

(q) New explosives and explosive devices except samples for laboratory examination and military explosives of a security classification approved by the United States Army Materiel Command: Commander, Naval Ordinance Systems Command, Department of the Navy; or Com-

mander, Air Force Systems Command and Commander, Air Force Logistics Command, Department of the Air Force. All other new explosives must be approved for transportation by the Department of Transportation.

(r) Loaded firearms.

§ 146.20-5 Acceptable explosives. (a) Acceptable explosives are divided by the Department of Transportation regulations into three classes according to degree of hazard in transportation, as follows:

Class A explosives, detonating or otherwise of maximum hazard
Class B explosives, inflammable hazard
Class C explosives, minimum hazard

(b) Acceptable explosives are defined by the Department of Transportation regulations as set forth in this subpart and such definitions are binding upon all shippers making shipments of any explosives by common carrier vessels engaged in interstate or foreign commerce by water. Such definitions are accepted and adopted and form part of the regulations in this subchapter applying to all shippers making shipments of explosives by any vessel and shall apply to the owners, charterers, agents, masters or persons in charge of vessels and to other persons transporting, carrying, conveying, storing, stowing or using explosives on board any vessel.

§ 146.20-7 Class A explosives. Class A explosives are defined as:

(a) **Type 1.** Solid explosives which can be caused to deflagrate by contact with sparks or flame such as produced by safety fuse or an electric squib, but cannot be detonated[1] by means of a No. 8 test blasting cap.[2] Examples: Black powder and low explosives.

(b) **Type 2.** Solid explosives which contain a liquid explosive ingredient and which, when unconfined,[3] can be detonated by means of a No. 8 test blasting cap,[2] or which can be exploded in at least 50 percent of the trials in the Bureau of Explosives' Impact Apparatus,[4] under a drop of 4 inches or more, but cannot be exploded in more than 50 percent of the trials under a drop of less than 4 inches. Examples: Commercial dynamite containing a liquid explosive ingredient.

(c) **Type 3.** Solid explosives which contain no liquid explosive ingredient and which can be detonated, when unconfined,[3] by means of a No. 8 test blasting cap,[2] or which can be exploded in at least 50 percent of the trials in the Bureau of Explosives' Impact Apparatus[4] under a drop of 4 inches or more, but cannot be exploded in more than 50 percent of the trials under a drop of less than 4 inches. Examples: Commercial dynamite containing no liquid explosive ingredient, trinitrotoluene, amatol, tetryl, picric acid, urea nitrate, pentolite and commercial boosters.

(d) **Type 4.** Solid explosives which can be caused to detonate when unconfined,[3] by contact with sparks or flame such as produced by safety fuse or an electric squib, or which can be exploded in the Bureau of Explosives' Impact Apparatus[4] in more than 50 percent of the trials under a drop of less than 4 inches. Examples: Initiating and priming explosives, lead azide, fulminate of mercury, etc.

(e) **Type 5.** Desensitized liquid explosives are explosives which may be detonated separately or when absorbed in sterile absorbent cotton, by a No. 8 test blasting cap,[2] but which cannot be exploded in the Bureau of Explosives' Impact Apparatus[4] by a drop of less than 10 inches. The desensitizer must not be significantly more volatile than nitroglycerin and the desensitized explosive must not freeze at temperatures above minus 10° F. Example: Desensitized nitroglycerin.

(f) **Type 6.** Liquid explosives that can be exploded in the Bureau of Explosives' Impact Apparatus[4] under a drop of less than 10 inches. Example: Nitroglycerin. See "Prohibited or not permitted explosives" in § 146.20-3.

(g) **Type 7.** (1) Blasting caps[5] are small tubes, usually made of an alloy of either copper or aluminum, or of molded plastic, closed at one end and loaded with a charge of initiating or priming explosives, Class A—Type 4, either with or without other suitable explosives. The total weight for explosives per unit shall not exceed 150 grains. Blasting caps[5] which have been provided with a means for firing by an electric current, and sealed, are known as electric blasting caps.

(2) Detonating primers are devices for commercial use which contain a detonator and an additional charge of explosives, all assembled in a suitable envelope.

(3) Detonating fuzes, class A explosives, are used in the military service to detonate the high explosive bursting charges of projectiles, mines, bombs, torpedoes, and grenades. In addition to a powerful detonator, they may contain several ounces of a high explosive, such as tetryl or dry nitrocellulose, all assembled in a heavy steel envelope. They may also contain a small amount of radioactive component. Those that are so made and packed that they will not cause functioning of other fuzes, explosives, or explosive devices in the same or adjacent containers are classed as class C explosives.

(h) **Type 8.** (1) Any solid or liquid compound, mixture or device which is not specifically included in any of the above types, and which under special conditions may be so designated and approved by the Bureau of Explosives. Example: Shaped charge, commercial.

(2) A shaped charge, commercial, consists of a plastic, paper, or other suitable container comprising a charge of not to exceed 8 ounces of a high explosive containing no liquid explosive ingredient and with a hollowed-out portion (cavity) lined with a rigid material. Detonators or other initiating elements shall not be assembled in the device.

(i) **Charged oil well jet perforating guns.** Charged oil well jet perforating guns are steel tubes, metallic strips, or tubular frameworks into which are inserted shaped charges connected in series by primacord. These devices are not permitted to be shipped as cargo on board any vessel subject to the regulations in this subchapter. Charged oil well jet perforating guns when carried in special motor vehicles under the conditions prescribed in 49 CFR 173.60 or on offshore downhole tool pallets, and accompanied by personnel trained in the safe handling of these devices are classed as Class C explosives: *Provided*, That:

(1) No blasting caps, electric blasting caps or other firing devices shall be affixed or installed in the guns.

(2) Each shaped charge shall contain not over 4 ounces of explosives.

(3) Each shaped charge if not completely enclosed in glass or metal shall be fully protected by a metal cover after installation in the gun.

(4) The total weight of the explosive contents of shaped charges assembled in guns being carried does not exceed 20 pounds per vehicle, pallet or vessel.

(j) **Type 9.** Propellant explosives, Class A, are solid chemicals or solid mixtures which are designed to function by rapid combustion of successive layers, generally with little or no smoke. The combustion is controlled by composition, size, and form of grain. Propellant explosives, Class A, include some types of smokeless powder and some types of solid propellant explosives for jet thrust units, rockets or other devices. Any propellant explosive in Class A which detonates in any one out of five trials when tested in the packages in which it is offered for transportation. In conducting the test, one propellant container shall be surrounded by inert loaded containers of the same weight, including one inert container placed on top of the propellant container. The propellant shall be ignited by means of a commercial electric squib placed within 4 inches of the bottom of the container. The presence of a crater and the absence of flame shall be considered as evidence of detonation.

§ 146.20-9 Class B explosives. (a) Class B explosives are defined as those explosives which in general function by rapid combustion rather than detonation and include some explosive devices, such as special fireworks, flash powders, some pyrotechnic signal devices and liquid or solid propellant explosives which include some smokeless powders.

(b) Propellant explosives, Class B, are solid or liquid chemical's or chemical mixtures which function by combustion. The combustion is controlled by composition, size, form of grain, or other chemical or mechanical means. Any propellant is Class B which fails to detonate in five trials when tested in the package in which it is offered for shipment. In conducting the test, one propellant container shall be surrounded by inert loaded containers of the same weight, including one inert container, placed on top of the propellant container. The propellant shall be ignited by means of a commercial electric squib placed within 4 inches of the bottom of the container. The presence of a crater and absence of flame shall be considered as evidence of detonation. Propellant explosives, Class B, include smokeless powder for small arms (see note 1), smokeless powder for cannon, liquid monopropellant fuel, smokeless powder, or solid propellant explosives for rockets, jet thrust units, or other devices. Black powder is not included in this classification and is defined in § 146.20-7(a). Fire extinguisher charges containing not to exceed 50 grains of propellant explosives per unit are exempt from the regulations in this part.

Note 1: Smokeless powder for small arms in quantities not exceeding 100 pounds net weight in one vehicle, container or other packaging authorized by 49 CFR 173.89(g) (except shipments by, for or to the Departments of the Army, Navy, or Air Force of the U.S. Government) shall be classed as a flammable solid for purposes of transportation when packaged in accordance with § 146.22-3(a). To be classed as a flammable solid, smokeless powder for small arms shall be limited to not more than 100 pounds in one hold or vehicular deck irrespective of the number of vehicles or containers.

§ 146.20-11 Class C explosives. Class C explosives are defined as certain types of manufactured articles which contain Class A or Class B explosives, or both, as components but in restricted quantities, and certain types of fireworks.

§ 146.20-13 New explosives, definitions; approval and notification. (a) As used in this section, "new explosive" means an explosive compound, mixture or device, produced by a person who:

---

[1] The detonation test is performed by placing the sample in an open end fiber tube which is set on the end of a lead block approximately 1½ inches in diameter and 4 inches high which, in turn, is placed on a solid base. A steel plate may be placed between the fiber tube and the lead block.

[2] A No. 8 test blasting cap is one containing 2 grams of a mixture of 80 percent mercury fulminate and 20 percent potassium chlorate, or a cap of equivalent strength.

[3] "Unconfined" as used in this section does not exclude the use of a paper or soft fiber tube wrapping to facilitate tests.

[4] The Bureau of Explosives impact apparatus is a testing device designed so that a guided 8-pound weight may be dropped from predetermined heights so as to impact specific quantities of liquid or solid materials under fixed conditions. Detailed prints may be obtained from the Bureau of Explosives, 1920 "L" Street, N.W., Washington, D.C. 20036.

[5] Blasting caps, blasting caps with safety fuse, or electric blasting caps in quantities of 1,000 or less are classified as Class C explosives.

(1) Has not previously produced that explosive compound, mixture or device; or

(2) Has previously produced the explosive compound, mixture or device, but has made a change in the formulation, design, process or production equipment. An explosive compound, mixture or device will not be considered a "new explosive" if an agency listed in paragraph (b) of this section has determined and confirmed in writing to the Office of Hazardous Materials Operations (OHMO), Department of Transportation, that there are no significant differences in hazard characteristics relative to the explosive compound, mixture or device previously approved.

(b) No person may offer a new explosive for transportation unless it has been examined, classed, and approved by one of the following agencies:

(1) Bureau of Explosives;

(2) The U.S. Energy Research and Development Administration (ERDA) for new explosives made by, or under the direction or supervision of ERDA, when tested in accordance with the Explosives Hazard Classification Procedures contained in DOD TB 700-2 (May 19, 1967), or

(3) U.S. Army Material Development and Readiness Command (DRCFS), Naval Sea Systems Command (NAVSEA 04H), or HQUSAF (IGD SEV) for new explosives made by, or under the direction or supervision of the Department of Defense when tested in accordance with the Explosives Hazard Classification Procedures contained in DOD TB 700-2 (May 19, 1967), (NAVORDiMST 8020.3 to 11A-1-47, DSAR 8220.1).

(c) Except as provided in paragraphs (d) and (e) of this section, each person who offers a new explosive for transportation, other than a new DOD explosive covered by a security classification, must file a copy of the approval for the new explosive accompanied by a supporting laboratory report of equivalent data with OHMO before offering the new explosive for transportation.

(d) Notwithstanding paragraph (b) of this section, any person may offer a sample of a new explosive that has not been approved for transportation by railroad, highway, or vessel to a laboratory for examination and approval if:

(1) The new explosive has been assigned a tentative shipping description and class in writing by one of the agencies listed in paragraph (b) of this section;

(2) The sample consists of no more than five pounds of the new explosive;

(3) The new explosive is packaged as required in this part according to the tentative description and class assigned unless otherwise specified in writing by one of the agencies listed in paragraph (b) of this section, and

(4) The package is labeled as required by this subchapter and the following is marked on the package:

(i) The words "SAMPLE FOR LABORATORY EXAMINATION";

(ii) The net weight of the new explosive, and

(iii) The tentative shipping description.

(e) Notwithstanding paragraph (b) of this section, a manufacturer of a new explosive that has not been examined or approved may transport that new explosive from where it was produced to an explosive testing facility if:

(1) The new explosive is not a forbidden explosive or an initiating explosive according to this part;

(2) If the new explosive is a compound or mixture, it must be described as high explosive or high explosive, liquid, as appropriate (other than when contained in a device) and packed, marked, labeled, and described on the shipping paper as required by this part;

(3) If the new explosive is a device, it must be assigned a tentative description and class by the owner and packed, marked, labeled, and described on the shipping paper as required by this part based on its tentative description and class.

(4) The new explosive is transported in a motor vehicle operated by the owner of the explosive, and

(5) The new explosive is accompanied by a person, in addition to the driver of the motor vehicle, who is qualified by training and experience to handle the explosive.

§ §146.20-15 through 146.20-51 [Removed]

§ 146.20-53 Magazine vessels. (a) General. The requirements of this section are applicable to magazine vessels and are in addition to any prescribed elsewhere in this part.

(b) Type vessel authorized. A single deck vessel with or without a house on deck is the only type vessel that may be used as a magazine vessel. A magazine vessel may not be moved while explosives are on board.

(c) Location of explosives. Class A and Class B explosives in excess of 5,000 pounds stored in any magazine vessel must be stowed below deck. No explosive may be stowed on deck unless the vessel is fitted with a deck house having a stowage area which meets the requirements in this subpart for the stowage of explosives. Quantities of blasting caps in excess of 1,000 may not be stored on the same magazine vessel with Class A or Class B explosives.

(d) Explosives storage spaces. Any compartment on a magazine vessel used for the stowage of explosives must be completely ceiled with wood so as to provide a smooth interior surface. Each metal stanchion in the compartment must be boxed in the same manner. An overhead ceiling is not required when the overdeck is weathertight. All nail and bolt heads must be countersunk and any exposed metal must be covered with wood.

(e) Primers and blasting caps. No initiating or priming explosive may be stowed in the same compartment with any other explosive when there is any high explosive on the same magazine vessel. Blasting caps must be stowed at least 25 feet from any bulkhead forming a boundary of a compartment containing any other explosives.

(f) Dry storage spaces. A magazine vessel having a dry storage space capable of being used for any purpose whatsoever must have a cofferdam at least 24 inches wide fitted between the dry storage space and each adjacent compartment containing explosives. The cofferdam must be constructed of wood or steel, formed by two tight athwartship bulkheads extending from the skin of the vessel to the overdeck. If the cofferdam extends to the weather deck, a watertight hatch must be fitted in the deck to provide access to the cofferdam.

(g) Lighting. Non-sparking, battery-powered, self-contained electric lanterns or non-sparking hand flashlights are the only means of artificial light authorized.

(h) Living quarters. Living quarters must be fitted on the inside with asbestos board or other equivalent fire resistant material. Bracketed ship's lamps are the only lighting fixtures authorized to be used in the living quarters. Any stove used for heating or cooking must be securely fastened and may not be mounted closer than 6 inches to the deck or sides of the house. Any smoke pipe for the stove which passes through the roof of the house must be kept at least 3 inches away from any woodwork. Each smoke pipe must be protected by a layer of asbestos, an air space of at least 1 inch, and a metal collar of at least 16 gauge sheets secured only on the weather side of the roof. There may be no opening from any living quarters into any stowage compartment.

(i) Storage of other hazardous materials. Magazine vessels having explosives on board may not be used for the storage of any other hazardous material.

(j) Magazine vessel's stores. Articles for use as stores on board any magazine vessel must be in compliance with the requirements of Part 147 of this title.

(k) Matches. Safety matches requiring a prepared surface for ignition are the only type of matches authorized for use on board a magazine vessel. They must be kept in a metal box or can with a metal cover and stored in the custodian's living quarters.

(l) Firearms. Firearms and ammunition (other than cargo) are not permitted on board a magazine vessel.

(m) Fire extinguishing equipment. No explosive may be received, stored, or dispensed from any magazine vessel, unless four 2½-gallon extinguishers of the soda-acid type and four 2-gallon pails filled with dry sand are placed about the vessel. The contents of each liquid extinguisher continuously exposed to a temperature lower than 40 degrees F. (45 degrees C.) must be modified or otherwise protected to prevent freezing.

(n) Supervision. A magazine vessel containing explosives must be continuously attended by a custodian employed for that purpose by the vessel's owner.

(o) Unauthorized persons on magazine vessels. The custodian of a magazine vessel shall prevent unauthorized persons from coming on board unless it is necessary to abate a hazard to human life or a substantial hazard to property.

(p) Repacking of explosives on board. No explosive may be repacked on board a magazine vessel. Any broken or damaged package must be placed in an open box and carried to a safe location for repacking or other disposition.

(q) Work boat. Each magazine vessel must be equipped with a work boat.

(r) Life preservers. One approved personal flotation device must be available for each person employed on a magazine vessel.

(s) Fenders. Each magazine vessel must be fitted with fenders in sufficient number and size to prevent any vessel tieing up alongside from coming in contact with the hull.

§ §146.20-55 through 146.20-300 [Removed]

SUBPARTS 146.21 THROUGH 146.28 [REMOVED]

SUBPART 146.29

DETAILED REGULATIONS GOVERNING THE TRANSPORTATION OF MILITARY EXPLOSIVES AND HAZARDOUS MUNITIONS ON BOARD VESSELS

§ 146.29-1 Effective date. The regulations in this subpart will become effective on and after July 1, 1962.

§ 146.29-3 Relationship to other regulations. (a) Commercial shipments of explosives shall be conducted in accordance with 49 CFR Parts 171–189.

(b) Where reference is made to other hazardous materials in this subpart, the regulations in 49 CFR Parts 171–189 apply.

§ 146.29-5 [Removed]

§ 146.29-7 Port security regulations. The applicable provisions of 33 CFR Parts 6, and 121 to 126, inclusive, shall, unless specifically authorized to the contrary by any provision of this subpart, be complied with by vessels, masters, agents, or charterers thereof and by all persons engaged in handling, loading, stowing or unloading explosives.

§ 146.29-9 Import shipments. Import shipments of military explosives shall be made in accordance with the provisions of the regulations in this subpart.

§ 146.29-11 Definitions and abbreviations. For the purpose of the regulations in this subpart, certain words, phrases, and abbreviations are defined as follows:

(a) **Military explosives.** Military explosives for the purpose of this subpart consist of all Department of Transportation's Classes A, B, and C explosives as defined below shipped by, for, or to the Departments of the Army, Navy, or Air Force of the United States or similar types of explosives shipped by, for, or to the government of any country whose defense is deemed vital to the defense of the United States. However, this definition shall not include those explosives shipped by, for, or to the Corps of Engineers, Department of the Army, for use in river and harbor works or other works under permits issued by that Agency, in which case the regulations in this part pertaining to commercial explosives shall apply. Military explosives are divided into two classes, as follows:

(1) **Ammunition.** Ammunition consists of all types of projectiles, cartridges, grenades, bombs, mines, torpedoes, torpedo warheads, propellant powder charges, pyrotechnics, rockets, missiles, special weapons, chemical, smoke or incendiary ammunition, or other "made up" explosive devices that are utilized by the armed forces in the prosecution of a war.

(2) **Explosives in bulk.** Explosives in bulk consist of any high explosives, black powder, and low explosives or propellant explosives in accordance with the definitions in §§ 146.20–1, 146.20–7, and 146.20–9, when such substances are shipped in containers other than containers such as bombs, grenades, mines, torpedoes, powder bags in individual containers, cartridges, projectiles, fuzes, detonators, caps, primers, and similar "made up" ammunition devices.

(b) **Hazardous munitions.** Hazardous munitions for the purpose of these regulations are those dangerous articles used as oxidizers or fuels for missile propulsive systems. Such fuels and oxidizers are listed in Tables XI–C and XI–D and will be stowed and handled in accordance with these tables when shipped with military explosives. When shipment is made on a vessel not carrying military explosives, the hazardous munitions may be shipped under the regulations contained in 49 CFR Parts 171–189.

(c) **Related terms.**

(1) **Adjacent hold; hold adjacent.** Any hold which has as one of its boundaries a permanent steel bulkhead that is common, either partially or in its entirety, to another hold shall be termed "adjacent hold" or "hold adjacent" to the local hold. This shall not be construed as meaning a hold above or a hold below said hold nor shall it include a hold that is situated diagonally from said hold and has only a corner as a common boundary.

(2) **Any hold above.** "Any hold above" shall mean any hold that is partially or entirely in the same vertical plane over another hold even though there may be a hold or holds intervening.

(3) **Any hold below.** "Any hold below" shall mean any hold that is partially or entirely in the same vertical plane under another hold even though there may be a hold or holds intervening.

(4) **Ammunition for cannon.** Ammunition for cannon is fixed, semi-fixed or separate loading ammunition which is fired from a cannon, mortar, gun, howitzer or recoilless rifle.

(5) **Ammunition for cannon with empty projectiles, inert-loaded projectiles, solid projectiles or without projectiles, and catapult charges exceeding 2 inches in diameter.** Ammunition for cannon with empty projectiles, inert-loaded projectiles, solid projectiles or without projectiles, and catapult charges exceeding 2 inches in diameter, is fixed ammunition assembled in a unit consisting of the cartridge case containing the propelling charge and primer with empty, inert-loaded, or solid projectiles, or without projectiles, which is fired from a cannon, mortar, gun, howitzer, or recoilless rifle.

(6) **Ammunition for cannon with projectiles.** Ammunition for cannon with explosive projectiles, gas projectiles, smoke projectiles, incendiary projectiles or illuminating projectiles is fixed ammunition assembled in a unit consisting of the cartridge case containing the propelling charge and primer, and the projectiles, fuzed or unfuzed.

(7) **Ammunition for small arms with explosive bullets or explosive projectiles.** Ammunition for small arms with explosive bullets or ammunition for small arms with explosive projectiles is fixed ammunition to be used in machine guns or similar fire arms and consists of a metallic cartridge case, the primer and the propelling charge, with explosive bullet or explosive projectile with or without detonating fuze, the component parts necessary for one firing being all in one assembly.

(8) **Boosters, bursters and supplementary charges.** Boosters and supplementary charges consist of a casing containing a high explosive and are used to increase the intensity of explosion of the detonator of a detonating fuze. Bursters consist of a casing containing a high explosive and are used to rupture a projectile or bomb to permit release of its contents.

(9) **Cargo hold.** A cargo hold is a space allotted entirely to the carriage of cargo and is bounded by permanent steel bulkheads, decks and the shell of the vessel; the deck openings being provided with means of effectively closing the hold against the weather, and in the case of superimposed holds, effectively closing off each hold.

(10) **Cargo net.** A cargo net is a net made of fiber or wire rope and used as a means of handling loose or package cargo to and from the hold of a vessel.

(11) **Cargo transporter.** This term covers a noncollapsible, reusable steel shipping box of not over 135 cubic feet capacity, used for shipping separate items of cargo as a unit, and handled on board ship by "lift-on lift-off" methods. Such container must conform to Military Specification MIL–B–11886 or MIL–B–21560. It is commonly referred to as "Conex Box."

(12) **Chemical ammunition.** Chemical ammunition used in warfare is all kinds of explosive chemical projectiles, bombs, grenades, mines, etc., loaded with toxic, tear, or other gas, smoke or incendiary agent, also such miscellaneous apparatus as cloud-gas cylinders, smoke generators, etc., that may be utilized to project chemicals.

(13) **Compartment.** A compartment is any space formed by permanent steel bulkheads and the ship's side and decks. The limits of a compartment are determined by the integrity of the bulkheads, shell or decks forming its boundaries. Access openings fitted with doors, hatch covers (steel or wood) or bolted plates are accepted as preserving the integrity of deck, bulkhead or shell.

(14) **Compatible explosives.** Compatible explosives as used in § 146.29-100 shall mean explosives that have compatibility in accordance with the admixture charts in § 146.29-99.

(15) **Complete round.** A complete round of "cannon ammunition," "artillery ammunition" or "gun ammunition" includes ammunition used in cannon or gun of caliber .75 in. and above. It includes complete round with components. The complete round comprises all of the components necessary to fire the cannon or gun once. These components are, in general, the projectile, fuze, propelling charge and primer. Depending upon both the type of propelling charge and method of loading the required components into the weapon, complete rounds of "cannon ammunition," "artillery ammunition" or "gun ammunition" are described as fixed, semifixed, separated or separate loading ammunition.

(16) **Container.** A container is a cargo carrying body other than a portable tank which may be designed and constructed to be removed from a chassis or wheels for water transportation. Military explosives permitted to be transported in containers are limited to explosives of Coast Guard Classes I and II, with the exception of Class II–J, which are compatible in accordance with the admixture charts in § 146.29-99. All other types of military explosives, including Class II–J may be carried in containers on approval of the Commandant.

(17) **Definition of other hazardous materials.** The definitions of other hazardous materials are in 49 CFR Parts 171–189.

(i) Radioactive materials, see § 146.19–1.
(ii) Flammable liquids, see § 146.21–1.
(iii) Flammable solids and oxidizing materials, see § 146.22–1.
(iv) Corrosive materials, see § 146.23–1.
(v) Compressed gases, see § 146.24–1.
(vi) Poisons, Class A, see § 146.25–5; Class B, see § 146.25–10; Class C, see § 146.25–15.
(vii) Combustible liquids, see § 146.26–1.
(viii) Hazardous articles, see § 146.27–1.

(18) **Detonating fuzes.** (i) Detonating fuzes, Class A are used in the military service to detonate the high explosive bursting charges of projectiles, mines, bombs, torpedoes, and grenades. In addition to a

powerful detonator, they may contain several ounces of a high explosive, such a tetryl or dry nitrocellulose, all assembled in a heavy steel envelope. They may also contain a small amount of radioactive component.

(ii) Detonating fuzes, Class C are those that are so made and packed that they will not cause functioning of other fuzes, explosives, or explosive devices in the same or adjacent containers.

(19) Division bulkhead.

(i) When part of a compartment or hold is utilized for the stowage of military explosives, the remaining portion of such compartment or hold may be utilized for the stowage of general cargo provided a temporary wooden bulkhead is constructed in the compartment or hold to completely divide and protect the stowage of military explosives from the general cargo. The scantlings and construction of such bulkheads shall be as follows: For tween deck compartments or holds construction shall be of commercial 2-inch boarding, secured on 4" × 6" uprights spaced not to exceed 30 inches center to center. For lower holds construction shall be of commercial 2-inch boarding secured on 6" × 6" uprights, spaced not more than 24 inches center to center. Random widths of boarding may be used. The boarding shall be close fitted edge to edge and butt to butt to form a smooth surface facing the explosive stowage. Nails shall not protrude beyond the surface of the boarding.

(ii) See § 146.29-81(e) for construction of a partition bulkhead within a Class "A" magazine measuring more than 40 feet in any direction.

(iii) When general cargo is to be stowed adjacent to the exterior of the Class "A" magazine see § 146.29-61(b).

(20) Dunnage. Lumber of not less than 1-inch commercial thickness laid over tank tops, decks or against bulkheads, frames, plating, ladders, etc., or used for filling up voids, or fitted around the cargo for the purpose of preventing damage during transportation.

(21) Explosive bombs. Explosive bombs are metal or other containers filled with explosives. They are used in warfare and include aeroplane bombs and depth bombs.

(22) Explosive mines. Explosive mines are metal or other containers filled with a high explosive.

(23) Explosive projectiles. Explosive projectiles are projectiles, guided missiles with warheads, warheads, or rocket heads, loaded with explosives or bursting charges, with or without other materials, for use in cannons, guns, tubes, mortars, or other firing or launching devices.

(24) Explosive torpedoes. Explosive torpedoes, such as are used in warfare, are metal devices containing a means of propulsion and a quantity of high explosives.

(25) Fixed ammunition. Fixed ammunition describes "cannon ammunition," "artillery ammunition" or "gun ammunition" of the type comprising a cartridge case with primer, a propellant charge and a projectile (fuzed or unfuzed) all of these components being assembled as a unit for one firing.

(26) Grenades. Grenades, hand or rifle, are small metal or other containers designed to be thrown by hand or projected from a rifle. They are filled with an explosive or a liquid, gas or solid material such as a toxic or tear gas or an incendiary or smoke producing material and a bursting charge.

(27) Guided missile ammunition. Includes missile or rocket bodies and related components; warheads (explosives, chemical practice, etc.); propellants (liquid or solid); fuzes and arming devices with associated components; fins, stabilizers, or control surfaces; either or all of which may be in complete round configuration or as separately packaged items, as issued to assemble complete rounds as fired.

(28) Hatch. An opening in the weather deck and all decks below in the same vertical plane through which cargo, etc., is passed. This term is also used in the regulations in this subpart to designate the entire series of holds served through one weather deck hatch.

(29) Igniters. Igniters consist of fiberboard, plastic, paper or metal tubes containing a small quantity of igniting compound which is ignited by the action of a primer, pull wire or scratch composition.

(30) Jet thrust units (jato), explosive (Class A), or igniters jet thrust (jato), explosive (Class A). Jet thrust units (jato), explosive (Class A), are metal cylinders containing a mixture of chemicals capable of burning rapidly and producing considerable pressure. Under certain conditions the chemical fuel with which the unit is loaded may explode. Jet thrust units are designed to be ignited by an electric igniter. They are used to assist airplanes to take off. Igniters jet thrust (jato), explosive (Class A) and igniters, rocket motor, Class A explosives, are devices consisting of an electrically operated or remotely controlled ignition element and a charge of fast burning composition meeting the definition prescribed for Type 1 Class A explosives assembled in a unit for use in igniting the propelling charge of jet thrust units or rocket motors. Under certain conditions the burning composition may explode.

(31) Jet thrust units (jato), Class B explosives. Jet thrust units (jato), Class B explosives are metal cylinders containing a mixture of chemicals capable of burning rapidly and producing considerable pressure. Jet thrust units are designed to be ignited by an electric igniter. They are used to assist airplanes to take off.

(i) Igniters, jet thrust (jato), Class B explosives, and igniters, rocket motor, Class B explosives are devices consisting of an electrically operated or remotely controlled ignition element and a fastburning composition which functions by rapid burning rather than detonation, assembled in a unit for use in igniting the propelling charge of jet thrust units, rocket motors, or rocket engines.

(ii) Starter cartridges, jet engine, Class B explosives, consist of plastic and or rubber cases, each containing a pressed cylindrical block of propellant explosive and having in the top of the case a small compartment that encloses an electric squib, small amounts of black powder and smokeless powder, which constitute an igniter. The starter cartridge is used to activate a mechanical starter for jet engines.

(32) On deck. "On deck" means that that article may be stowed on the open weather deck of the vessel.

(33) Overstow. The term "overstow" as used in these regulations shall mean to stow directly over.

(34) Pallet. A pallet is a tray so designed as to be picked up by a fork truck or similar cargo handling equipment. Pallets are not usually equipped with sideboards.

(35) Palletized unit. Individual packages or unpackaged items stowed in a compact mass upon a pallet or skids and banded together and to the pallet or skids by metal straps to form a unit consisting of pallet and packages.

(36) Partition bulkhead. A partition bulkhead is a temporary bulkhead constructed of commercial 1-inch lumber of widths not less than 4 inches, secured alternately on both sides of the uprights and spaced not more than 6 inches apart. The uprights are at least 2" × 4" size, spaced not more than 30 inches apart.

(37) Percussion fuzes, combination fuzes, and time fuzes. Percussion fuzes, combination fuzes, and time fuzes are devices designed to ignite powder charges of ammunition or to initiate an intermediate charge (booster) in projectiles, bombs, etc. When such fuzes are assembled with booster charges they are properly described as "detonating fuzes."

(38) Pieplate. A pieplate is the term generally applied to a round, oval or hexagonal tray without sideboards.

(39) Primers. Primers are devices used to ignite the powder charges of ammunition. For small-arms ammunition, the primers are "small-arms primers" or "percussion caps."

(40) Propellant explosives, solid, Class A. Propellant explosives, Class A, are solid chemicals or solid chemical mixtures which are designed to function by rapid combustion of successive layers, generally with little or no smoke. The combustion is controlled by composition, size, and form of grain. Propellant explosives, Class A, include some types of smokeless powder for small arms and some types of solid propellant explosives for jet thrust units, rockets, or other devices. Any propellant explosive is Class A which detonates in any one out of five trials when tested in the package in which it is offered for transportation. In conducting the test, one propellant container shall be surrounded by inert loaded containers of the same weight, including one inert container placed on top of the propellant container. The propellant shall be ignited by means of a commercial electric squib placed within 4 inches of the bottom of the container. The presence of a crater and absence of flame shall be considered as evidence of detonation.

(41) Propellant explosives, solid, Class B. Propellant explosives, Class B, are solid chemicals or solid chemical mixtures which function by rapid combustion of successive layers, generally with little or no smoke. The combustion is controlled by composition, size, and form of grain. Any propellant explosive in Class B which fails to detonate in five trials when tested in the packages in which it is offered for shipment. (See (40) for test.) Propellant explosives, Class B, include smokeless powder for cannon, smokeless powder or solid propellant explosives for rockets, jet thrust units, or other devices. Black powder is not included in this classification.

(42) Rocket ammunition. Rocket ammunition is fired ammunition which is fired from a tube, launcher, rails, trough, or other device as distinguished from cannon ammunition which is fired from a cannon, gun, or mortar.

(43) Rocket motor, Class A explosives. Rocket motor, Class A explosives, is a device containing a propelling charge and consisting of one or more continuous type combustion unit(s) closed at one end (closure may be an igniter with a thrust plate) and with a nozzle(s) at the other end. (The rocket motor carries its own solid oxidizer-fuel combination.) The propelling charge consists of a mixture of chemicals and or chemical compounds which when ignited is capable of burning rapidly and producing considerable pressure and which will sustain a detonation. Rocket motors, Class A explosives, should be nonpropulsive in shipment (see subparagraph (i) of this paragraph). Rocket motors, Class A explosives, are designed to be ignited by an electrically actuated device which may be an igniter, or by other means. They are used to propel and or provide thrust for guided missiles, rockets, or spacecraft.

(i) A rocket motor to be considered "nonpropulsive" must be capable of unrestrained burning and will not move appreciably in any direction when ignited by any means. Blast deflectors, thrust

For explanation of abbreviations and reference marks, see last page of this tariff.

neutralizers, or other similar devices must be proven adequate by test prior to authorization for use.

(44) **Rocket motor, Class B explosives.** Rocket motor, Class B explosives, is a device containing a propelling charge and consisting of one or more continuous type combustion unit(s), closed at one end (closure may be an igniter with a thrust plate) and with a nozzle(s) at the other end. The propelling charge consists of a mixture of chemicals and/or chemical compounds which when ignited is capable of burning rapidly and producing considerable pressure and which will not sustain a detonation. (The rocket motor carries its own solid oxidizer-fuel combination.) Rocket motors, Class B explosives, should be nonpropulsive in shipment (see subparagraph (i) of this paragraph). Rocket motors, Class B explosives, are designed to be ignited by an electrically actuated device which may be an igniter, or by other means. They are used to propel and/or provide thrust for guided missiles, rockets, or spacecraft.

(i) A rocket motor to be considered "nonpropulsive" must be capable of unrestrained burning and will not move appreciably in any direction when ignited by any means. Blast deflectors, thrust neutralizers or other similar devices must be proven by test prior to authorization for use.

(45) **Rocket engine (liquid), Class B explosives.** Rocket engine (liquid), Class B explosives is a complete, self-contained rocket propulsion unit which contains an oxidizer and a fuel, each separated by an aluminum or stainless steel wall of not less than 0.250 inch thickness. Double walls are permitted. Pressurization of the propellant tanks is by use of a gas generator. The ignition source must be in an unarmed position for shipment. Rocket engines (liquid) are used to propel or provide thrust for rockets, missiles or spacecraft.

(46) **Semifixed ammunition (Army).** Complete rounds composed of a projectile (fuzed) and a cartridge case with a primer and propellant charge which is in a cloth bag or bags of small size. The base of the projectile fits free in the neck of the cartridge case and may be readily detached from the cartridge case. The round is loaded into the cannon with the projectile assembled to the cartridge case and is handled similarly to fixed ammunition in loading. It may be packed with the projectile disassembled from the cartridge case containing the propellant. The projectile is usually assembled loosely in the cartridge case and is packed in the same individual container.

(47) **Semifixed ammunition (Navy).** Semifixed ammunition is ammunition in which the primer and the propellant charge are firmly secured in the cartridge case with the projectile separate from the cartridge case. The propellant charge is loaded loosely in the cartridge case, differing in this respect from that of the Army which is loaded in a bag. The end of the cartridge case is sealed with a prepared plug or disc which is fired with the powder and is usually shipped stowed in a metal tank. The projectile is shipped separate. The U.S. Army may refer to this ammunition as separate loading ammunition.

(48) **Separate loading ammunition.** Complete rounds in which the separate components—projectile, propellant charge and primer—are loaded into the cannon or gun separately are known as "separate loading ammunition." Although the propellant charge may be in one section, it is usually divided into parts with each part assembled in a bag packed in outside shipping containers which may be of wood, fiber, or metal.

(49) **Separated ammunition.** In this type of ammunition, the propellant is sealed in a metal cartridge case into which a primer is fitted and this assembly is called a propelling charge. It is separate from the projectile with which it is used but the projectile and the propelling charge are loaded into the weapon in one operation. Separated ammunition is generally used in medium caliber antiaircraft and antitank guns.

(50) **Shelter deck space.** A shelter deck space is a space available for cargo situated above the uppermost complete continuous deck (main deck) and the deck next above. Normally this space contains no permanent watertight transverse bulkheads except at its forward and aft extremities.

(51) **Shoring.** Shoring is a method of securing cargo against movement sidewise or downward. In this subpart it describes the use of timbers fitted vertically or at an angle to the side of the stowage. It may also describe the use of timber to support a stowage from moving downward.

(52) **Skipboard.** A skipboard is the term generally applied to a rectangular or square tray without sideboards.

(53) **Small arms ammunition.** Small arms ammunition is fixed ammunition consisting of a metallic, plastic composition, or paper cartridge case, a primer and a propelling charge, with or without bullet, projectile, shot, tear gas material, tracer components, or incendiary compositions, or mixtures, and is further limited to the following:

(i) Ammunition designed to be fired from a pistol, revolver, rifle, or shotgun held by the hand or to the shoulder.

(ii) Ammunition of caliber less than 20 millimeters with incendiary, solid, inert or empty projectiles (with or without tracers), designed to be fired from machine guns or cannons.

(iii) Blank cartridges including canopy remover cartridges, starter cartridges, and seat ejector cartridges, containing not more than 500 grains of propellant powder, provided that such cartridges shall be incapable of functioning en masse as a result of the functioning of any single cartridge in the container or as a result of exposure to external flame.

(iv) Twenty millimeter ammunition without explosive projectiles or incendiary projectiles.

(54) **Special fireworks.** Special fireworks are manufactured articles designed primarily for the purpose of producing visible or audible pyrotechnic effects by combustion or explosion. Examples are toy torpedoes, railway torpedoes, some firecrackers and salutes, exhibition display pieces, aeroplane flares, illuminating projectiles, incendiary projectiles or incendiary bombs and smoke projectiles or smoke bombs fuzed or unfused and containing expelling charges but without bursting charges, hand or rifle grenades with ignition elements but not containing bursting charges, flash powders in inner units not exceeding 2 ounces each, flash sheets in interior packages, flash powder or spreader cartridges containing not over 72 grains of flash powder each and flash cartridges consisting of a paper cartridge shell, small-arms primer, and flash composition, not exceeding 180 grains all assembled in one piece. Fireworks must be in a finished state, exclusive of mere ornamentation, as supplied to the retail trade and must be so constructed and packed that loose pyrotechnic composition will not be present in packages in transportation.

(55) **Superstructure.** Superstructure is a structure of a vessel located on the weather deck integral with the deck and of substantial weight and size to provide physical separation of cargoes, e.g., deck house, mast house, bridge structure, etc.

(56) **The hold above.** "The hold above" shall be a hold immediately above another hold having its deck, either partially or in its entirety, common to the overhead of the hold below.

(57) **The hold below.** "The hold below" shall be a hold immediately below another hold having its overhead, either partially or in its entirety, common to the deck of the hold above.

(58) **Tomming.** Tomming is a method of securing cargo against displacement of movement upwardly.

(59) **Tray.** A tray is any flat group of boards securely fastened to bearers in order to provide a level surface for the loading of cargo. Trays are given various names, those applied in some ports differing from those in other ports, according to (i) shape, (ii) method of securing to cargo handling gear, or (iii) use or lack of sideboards in conjunction with the tray.

(60) **Tracer fuzes and tracers.** Tracer fuzes and tracers are devices which are attached to projectiles and contain a slow-burning composition to show the flight of projectiles at night.

(61) **Tween deck height.**

(i) For the purpose of load calculations the height of a tween deck is ascertained by measuring the distance from the heel of the overhead deck beam to the heel of the underdeck beam. (The thickness of the plating forming the deck is not deducted from the height.)

(ii) For height of a tween-deck affected by the sheer of a deck, measure as above at both the forward and after ends of the hold and divide the sum of these heights by two.

(62) **Tween deck hold.** A tween deck hold is a space located between the weather deck and the lower hold.

(63) **Type "A" dunnage floor.** A type "A" dunnage floor shall be constructed of two layers of commercial 1-inch dunnage of widths not less than 4 inches fitted as close as possible, edge to edge, and butt to butt, the top course being laid crosswise to the lower course, or of a single layer of 2-inch lumber of widths not less than 6 inches fitted as close as possible edge to edge, and butt to butt. When using 2-inch lumber over hatch boards the lumber shall be laid fore and aft.

(64) **Type "B" dunnage floor.** A type "B" dunnage floor shall be constructed of one layer of commercial 1-inch thick dunnage of widths not less than 4 inches fitted as close as possible, edge to edge, and butt to butt.

(65) **Accessible stowage.** Accessible stowage is one which can enable a fire-fighting party with equipment to approach with ease.

(d) **Abbreviations.**

AA	Antiaircraft.
AAC	8.3Antiaircraft common.
AA Com ...	9.7Antiaircraft common.
AC	Aircraft cannon.
AC	Hydrocyanic acid.
A.C.E.I.S. ..	Aircraft emergency identification signals.
A.D.F.	Auxiliary detonating fuze.
AIC	Ammunition identification code (Army).
ALN	Ammunition lot number.
Amm	Ammunition.
Ammo	Ammunition.
AP	Armor-piercing.
APC	Armor-piercing capped.
APT	Armor-piercing tracer.
ASSEM	Assembled.
AT	Anti-tank.
Aux	Auxiliary.
Aux Det	Auxiliary detonating fuze.
BBC	Bromobenzylcyanide (tear gas).

BQ ..... Bursting charge.
BD ..... Base detonating.
BDF ..... Base detonating fuze.
BL and P .. Blind loaded and plugged.
BL and T ... Blind loaded and tracer.
BP ..... Black powder.
BUWEPS .. Bureau of Weapons.
BUR CHG .. Bursting charge.
CAL ..... Caliber.
CCIP ..... Case combination ignition primer.
CHG ..... Charge.
CG ..... Phosgene.
CK ..... Cyanogen chloride.
CL ..... Chlorine.
Cml-C ..... Chemical Corps.
CNS ..... Chloracetophenone solution (tear gas).
COM ..... Common.
Comp A .... RDX-Wax explosive.
Comp B .... RDX-TNT explosive.
Comp C ... Plastic type RDX explosive.
Cor ..... Corrosive materials.
CPI ..... Case percussion igniter.
CPP ..... Case percussion primer.
CT-TNT ... Cast TNT.
D ..... Explosive "D" (ammonium picrate).
DA ..... Diphenylchlor arsine.
DC ..... Depth charge.
DDR ..... Dummy drill.
DEMO ..... Demolition.
DM ..... Adamsite (sneeze gas).
DP ..... Diphosgene.
EX ..... Experimental.
EXP ..... Expellant or explosive.
EXP "D" ... Explosive "D".
F ..... Fuze.
FC ..... Full charge.
FFAR ..... Folding fin aircraft rocket.
FFFG ..... Fine fine fine grain (black powder).
FFG ..... Fine fine grain (black powder).
FG ..... Fine grain (black powder).
FG. ..... Flammable compressed gas.
FL ..... Flammable liquid.
FM ..... FM smoke mix (titanium tetrachloride).
FNH ..... Flashless, nonhygroscopic.
FP ..... Flashless pellets.
FRAG ..... Fragmentation.
FS ..... FS smoke mix (sulfur trioxide).
FS. ..... Flammable solid.
GB ..... Isopropyl methylphosphonofluoridate (nerve gas).
GP ..... General purpose.
H ..... Mustard gas.
HBX, H6 ... RDX-TNT-AL type explosive.
HC ..... Hexachlorethane mixture (smoke).
HC ..... High capacity.
HD ..... Distilled mustard.
HE ..... High explosive.
HEAT ..... High explosive antitank.
HEI ..... High explosive incendiary.
HEIT ..... High explosive incendiary tracer.
HET ..... High explosive tracer.
HMX ..... Cyclotetramethylenetrinitramine.
HN ..... Nitrogen mustard gas.
HPAG ..... High performance air to ground (rocket).
HVAR ..... High velocity aircraft rocket.
ICC ..... Interstate Commerce Commission.
ILLUM ..... Illuminating.
IM ..... Thickened gasoline.
IN ..... Inert.
INCEND ... Incendiary.
L ..... Lewisite.
LC ..... Light case.
LE ..... Low explosive.
L and F .... Loaded and fuzed.
L and P .... Loaded and plugged.
M ..... Model (Army).
Maj Cal .... Major caliber.
MCBD ..... Major caliber base detonating.
MG ..... Magnesium.
MIN CAL ... Minor caliber.
MK ..... Mark.
MM ..... Millimeter.
Mod ..... Modification.
MTF ..... Mechanical time fuze.
NC ..... Nitrocellulose.
NF ..... Nose fuze.
NH ..... Non-hygroscopic.
Nonfl. G .... Nonflammable compressed gas.
NP ..... Thickened gasoline.
O H ..... Overhauled.
ORD ..... Ordnance.
Oxy M ..... Oxidizing material.
PD ..... Point detonating
PDF ..... Point detonating fuze.
PENT ..... Pentolite.
PERC ..... Percussion.
Pois A ..... Poison gas or liquid, Class A.
Pois. B .... Poison liquid or solid, Class B.
Pois. C .... Tear gas, Class C.
Pois. D .... Radioactive material, Class D.
PRAC ..... Practice.
PRI ..... Primer.
PROJ ..... Projectile.
PS ..... Chlorpicrin.
PT ..... Thickened fuel.
PWP ..... Plasticized white phosphorus.
RD ..... Round.
RDX ..... Cyclotrimethylenetrinitramine (cyclonite).
SA ..... Small arms.
SAP ..... Semi-armor piercing.
SCAR ..... Sub-caliber aircraft rocket.
SEIS ..... Ship's emergency identification signals.
SF ..... Semi-fixed.
SQ ..... Super quick.
T ..... Tentative model designation.
TET ..... Tetryl (trinitrophenylmethylnitramine).
TF ..... Time fuze.
TH ..... Thermate or Thermite
TNT ..... Trinitrotoluene.
TPX ..... Torpex.
VT ..... Variable time (proximity) (VT).
w ..... with.
w/o ..... without.
WP ..... White phosphorous.

§ 146.29-13 Permit for handling military explosives. (a) Shipments of military explosives and military lethal chemicals except material covered in § 146.29-100 as Coast Guard Class I shall not be laden on, handled nor discharged from any vessel at any port or place in the United States, its territories or possessions (not including the Panama Canal Zone) until authorization has been obtained by the owner, agent, charterer, master, or person in charge of the vessel from the District Commander of the U.S. Coast Guard, Captain of the Port, or other officer designated by the District Commander.

(b) Before a permit is issued authorizing the loading, handling or discharging of military explosives or military lethal chemicals in accordance with paragraph (a) of this section, the permittee shall file a written application for a permit authorizing the loading or handling or discharging. When filed, the application for loading or handling shall be accompanied by a preliminary manifest of all explosives or other dangerous articles comprising the cargo of the vessel together with a preliminary cargo stowage plan showing the proposed stowage of all such cargo. Changes in final stowage from that shown in the preliminary cargo stowage plan may be made upon approval of the issuing officer.

§ 146.29-14 Dangerous cargo manifest, list or stowage plan. (a) The master of a vessel transporting military explosives shall prepare a dangerous cargo manifest, list or stowage plan. This document must be kept in a designated holder, on or near the vessel's bridge while the vessel is in the navigable waters of the United States.

(b) The information required to appear on the dangerous cargo manifest, list or stowage plan by the provisions of paragraph (c) of this section shall be the information actually furnished to the vessel by the shipper of the military explosives or hazardous munitions upon his bill of lading or other shipping paper. This shipping order shall comply with the provisions of § 146.05-12 of this subchapter.

(c) This manifest, list or stowage plan shall show thereon the following information:

(1) Name of vessel and official number. (If the vessel has no official number, the international radio call sign shall be substituted.)

(2) Nationality of vessel.

(3) True shipping name of all military explosives as specified in § 146.29-100. Noun descriptions must be used.

(4) Tonnage in bulk shipment or the number and description of the outside containers and their gross weight.

(5) Classification of the military explosives as specified in § 146.29-100.

(6) DOT label applied to the package if any required.

(7) The stowage location of the explosives on board the vessel.

(8) Signature of the Master or other officer of the vessel authorized by the Master to sign for him.

(d) When military explosives are transported on board a vessel which is transporting other hazardous materials, the manifest list or stowage plan required by this section may be incorporated in the one required by 49 CFR 176.30.

(e) The manifest, list, or stowage plan aboard the vessel shall be

produced upon demand of the Commandant of the Coast Guard or his authorized representative.

(f) Owners, charterers, or agents of vessels transporting or storing military explosives or hazardous munitions shall retain ashore for one year a copy of the manifest, list, or stowage plan and shall produce said manifest or list in accordance with the provisions of § 146.02-22.

(g) Manifests for storage vessels shall be prepared according to the provisions of § 146.06-20 of this subchapter.

§ 146.29-15 Authority to load, handle or discharge; facilities and use. (a) Military explosives, except material covered in § 146.29-100 as Coast Guard Class I, shall not be handled, stowed, stored, loaded on, or discharged from a vessel except at one of the following:

(1) Explosives anchorages; the areas upon the navigable waters that are designated explosives anchorages under the applicable provisions of 33 CFR Parts 109 and 110 (Anchorage Regulations), and within which a vessel may anchor or moor to handle, stow, store, load, or discharge explosives as cargo.

(2) Designated waterfront facility of particular hazard (33 CFR 126.05(b)); the facility which has been specifically authorized by the District Commander or Captain of the Port for this purpose.

(3) Temporary location; a location the District Commander or Captain of the Port may designate as a temporary location for a specific loading of Classes XI-A, XI-B, XI-C, and XI-D ammunition.

(b) A vessel, subject to the regulations in this part, may load or discharge military explosives at any Army or Navy depot, arsenal, navy yard, port of embarkation or other facility under the direct control and operation of the Navy, or Army, provided a permit authorizing such loading has been granted to the vessel owner, agent, charterer, master, or person in charge of the vessel by the Captain of the Port. (See §§ 146.29-19 and 146.29-21.)

(c) In an emergency arising by reason of military necessity or casualty, a vessel may upon authorization by a Captain of the Port, load or discharge military explosives in any location authorized by said Captain of the Port.

§ 146.29-17 Prohibited explosives. (a) Explosives prohibited by subsection 3 of R.S. 4472, as amended (46 U.S.C. 170) (fulminates or other detonating compounds in bulk in dry condition, or explosive compositions that ignite spontaneously or undergo marked decomposition when subjected for 48 consecutive hours to a temperature of 167 degrees Fahrenheit, or compositions containing an ammonium salt and a chlorate, or other like explosives) shall not be accepted by any vessel.

(b) A passenger vessel shall not accept any Class A or Class B military explosives for transportation as cargo.

§ 146.29-19 Explosives loading supervisory detail. (a) There may be assigned to every vessel, subject to the regulations in this part, loading, handling, or discharging military explosives at an explosives anchorage or waterfront facility as may be approved by the Captain of the Port or the District Commander for the loading or unloading of military explosives, a Coast Guard detail to supervise such loading, handling or discharging. The owners, agents, charterers, masters or persons in charge of the vessel and all persons engaged in the handling, loading and stowage of the military explosives shall obey all orders, oral or written, that are given by the person in charge of such assigned detail.

(b) A vessel, subject to the regulations in this part, loading, handling, or discharging military explosives except material covered in § 146.29-100 as Coast Guard Class I at a Navy or Army depot, arsenal, navy yard, port of embarkation or other facility under the direct control and operation of the Navy or Army shall apply to the Captain of the Port for a permit for such loading, handling or discharging. A Coast Guard detail may be assigned to such a vessel unless the Commanding Officer of such Navy or Army facility declines the detail.

§ 146.29-21 Personnel identification. The provisions of this section shall apply to vessels loading, handling or discharging military explosives in accordance with the provisions of § 146.29-19 (a).

(a) No person shall enter upon a vessel loading, handling, or discharging military explosives unless such person first identifies himself to the satisfaction of the Coast Guard detail.

(b) Every person who is permitted to enter into a magazine or a hold or compartment of a vessel wherein military explosives are being handled or stowed shall provide the Coast Guard representative with his name and address and the name and address of the firm employing him, furnishing satisfactory identification to substantiate such information.

(c) A person who, for any reason, is requested to leave a vessel loading, handling or discharging military explosives by the person in charge of the Coast Guard detail shall immediately obey the request and not return until permission is granted.

§ 146.29-23 Ship's officer present. (a) During the entire operation involving the building of a magazine, the preparation of holds, and the actual handling and stowage of military explosives, it shall be the responsibility of the master of the vessel to assign a deck officer of the vessel who shall be in constant attendance. It shall be these officers' responsibility to see that the provisions of the regulations in this part insofar as such provisions apply to the vessel, are complied with.

(b) It shall be these officers' further responsibility at the end of the work shift to see that all means of access to the partially loaded holds are closed off in such a manner as to provide the maximum safety and protection for the explosives stowed within the hold.

§ 146.29-25 Fires and fire protection. (a) No unnecessary fire shall be permitted on a dock, lighter, or vessel while loading, handling, or discharging military explosives.

(b) Every fire deemed necessary must be properly safeguarded and for the entire period of cargo transfer shall be in constant charge of a competent person assigned for that purpose by the master or by the person in charge of the vessel or by the person in charge of the dock.

(c) (1) Every vessel engaged in the handling and transfer of military explosives and equipped with means of power, heating, cooking, or lighting involving use of smoke pipes or stacks shall have such smoke pipes and or stacks protected by spark screens. For the purpose of screening smoke pipes, vessels shall be divided into two categories. Large or ocean vessels shall have their main smoke pipes protected by corrosion resistant screens of not larger than ½-inch mesh and small or inland vessels and small or auxiliary smoke pipes on large vessels by screens not larger than ¼-inch mesh.

(2) Insofar as practicable, unless the barge, lighter, etc. is loading or discharging military explosives to or from the vessel, barges, lighters, tow boats, and other types of vessels shall not come alongside a vessel handling, stowing, storing, loading, discharging or transporting military explosives opposite the area where hatches serving a hold containing explosives are open. (See § 146.29-73(1).)

(3) This paragraph is not applicable to vessels transiting main channels contiguous to explosives loading facilities or anchorages.

(4) Vessels loading or unloading Class I ammunition at waterfront facilities not designated by the Captain of the Port as explosives loading piers do not require screening of smoke pipes and or stacks.

(d) Welding or cutting operations involving the use of open flames or arc shall not be undertaken on a vessel having military explosives on board as cargo, except in case of an emergency affecting the security of a vessel, or for the purpose of welding pad eyes, angle bars or other devices to the deck for securing deck cargo. Such welding or cutting shall be done only on special permission of the Captain of the Port, and then only in the presence of an officer of the Coast Guard detail and in conformity with said officer's instructions.

(e) The cleaning of fireside of boilers shall not be undertaken on a vessel while at an explosives or ammunition loading facility or anchorage except upon express permission of the Captain of the Port.

(f) All tubes and uptakes of the vessel must be thoroughly swept or blown and reasonably free of soot prior to the arrival of the vessel at an explosives or ammunition loading facility or anchorage. A vessel at an explosives ammunition loading facility or anchorage shall not blow tubes or uptakes except upon permission of the Captain of the Port and then the operation shall be under the supervision of the master or person in charge of the vessel with a licensed engineer in attendance.

(g) Bunkering of a vessel shall not be done while the vessel is at an explosives loading or ammunition loading waterfront facility. When at an anchorage, an explosives laden vessel may engage in bunkering operations provided explosives are not being loaded, handled, or discharged, and all holds in which explosives are stowed are secured.

(h) A vessel at an explosives or ammunition loading facility or anchorage shall not transfer fuel oil between its own fuel oil storage tanks or from its storage tanks to the settling tank, except under the close supervision of a licensed engineer who shall be in constant attendance until the operation is completed.

(i) [Reserved]

(j) The transfer of lubricating oils and cleaning oils, either from containers on board the vessel or by pipeline or hose shall be prohibited at an explosives or ammunition loading facility. However, the transfer on board the vessel of galley fuel oil may be authorized by the Captain of the Port when the galley stove is cold, or when the vessel is equipped with an overflow system which returns surplus fuel oil from the galley tanks back into the main storage tanks provided such transfer is under the supervision of the master or person in charge of the vessel with a licensed engineer in attendance.

(k) The fueling of powered lifeboats or units of the vessel's machinery shall not be done while the vessel is at an explosives or ammunition loading facility.

(l) Boiler room and engine room bilges must be clean and free of oil or unnecessary residue before the vessel proceeds to an explosives or ammunition loading facility or anchorage, and it is further required that the bilges be maintained in this condition during the entire time the vessel is moored at the explosives or ammunition loading facility or anchorage. Attention is invited to the provisions of the Oil Pollution Acts of 1924 and 1961, and the Refuse Act, 1899, which prohibit the discharge of oil into the navigable waters of the United States. The term "oil" means oil of any kind or in any form, including fuel oil, oil sludge, and oil refuse.

(m) On every vessel located at explosives loading facility or anchorage or ammunition loading facility no work shall be undertaken on the main propulsion machinery, auxiliaries or boilers that will render inoperative fire pumps, electric power or propulsion of the vessel without express authority of the Captain of the Port. When the repairs authorized

make inoperative the main propulsion unit an auxiliary tug shall stand by.

(n) (1) Every self-propelled vessel having on board military explosives shall at all times maintain means of propulsion. When not under way, such a vessel shall have available on deck, fore and aft, hawsers capable of being used for emergency towing. The eye of such hawser shall be clear of the chock with messenger attached and ready to run and the ship's end shall be stopped off on the bitts to permit reasonable scope of hawser for towing. A heaving line made up and secured to the rail by rope yarn shall be bent to the messenger. Fire axes shall be kept conveniently at hand, fore and aft, to be used on the ship or passed to the dock for cutting mooring lines in case of an emergency.

(2) Nonself-propelled vessels having on board military explosives when moored or anchored shall have at least one tug for each facility or area at which they are moored or anchored.

(o) Every vessel loading or unloading military explosives shall display at its masthead by day a red flag at least 16 square feet in area or at least 10 feet above the upper deck if the vessel has no mast, and at night, while fast to a dock, a red light in the position specified for the flag.

(p) Any device, such as a radio, radar, etc., capable of radiating electromagnetic energy shall be de-energized by opening the main switches thereto, and these switches shall be tagged to warn personnel against reenergizing the circuits whenever the vessel is at an explosives or ammunition handling facility, at an explosive anchorage with a barge or other type of vessel containing explosives alongside, or when a hatch containing explosives is uncovered.

§ 146.29-27 Fire hose. (a) During the handling, loading, or unloading of military explosives the vessel shall "run out" or otherwise make ready for quick use a *minimum of two* lines of hose on the weather deck, one fore and one aft. These hoses shall be of sufficient length so that a stream of water from at least one hose can reach all areas of the weather deck. The fire hose valves *controlling* these lines shall remain "cracked open" (except in freezing weather) so casual observation may indicate that water is available.

(b) Additional fire lines shall be "run out" or otherwise made ready at each hold or compartment working or containing military explosives when the hatch serving the hold is open. These lines shall of sufficient length so that a stream of water can be directed onto all portions of the hold or compartment.

(c) Fire lines "run out" or otherwise made ready shall be fitted with an approved combination spray nozzle.

§ 146.29-29 Smoking. (a) Smoking is prohibited on or near any vessel handling, loading or unloading military explosives at an explosives or ammunition loading pier. Smoking areas may be designated upon approval by the Captain of the Port provided such areas are located at a safe distance from the vessel. "No Smoking" warning signs shall be posted during operations of handling, loading or unloading such cargo. At least one such "No Smoking" sign shall be located on the pier at a reasonable distance from the vessel when such handling, loading, or unloading is taking place at a pier.

(b) Smoking is prohibited on or near any vessel handling, loading, or unloading explosives at an explosives anchorage, except the Captain of the Port may, with the concurrence of the master or person in charge of the vessel, designate a compartment as a smoking area. This compartment will be provided with electric lighting devices without open flame. "No Smoking" warning signs shall be posted conspicuously in other parts of the vessel during operations of handling, loading, or unloading.

(c) The Captain of the Port may approve a room aboard ship to be a designated "Smoking room for the ship's personnel only," while at a pier or anchorage; provided the necessary approved firefighting equipment is at hand and portholes, vents, and doors are effectively screened with approved screening and electric cigarette lighting devices without open flame are provided.

§ 146.29-31 Liquor or drugs. No person who, in the judgment of the master, person in charge of the vessel, or the officer in charge of the Coast Guard detail, is considered as being under the influence of intoxicating liquor or of drugs shall be permitted on board a vessel while operations involving the handling, loading, unloading, or transportation of explosives are being carried on, except if the person under the influence of intoxicating liquor or drugs in a bona fide member of the crew of the vessel involved, he may at the discretion of the Officer-in-Charge of the Coast Guard detail board the vessel: *Provided*, That the master or person in charge of the vessel will accept custody and full responsibility for said person. *And provided further*, That this person shall not be permitted to perform any work on the vessel while under the influence of intoxicating liquor or drugs.

§ 146.29-33 Cargo working gear and equipment. (a) Before military explosives are loaded or unloaded on or from a vessel the master or other person in charge of the vessel is required to ascertain by examination the adequacy, the condition and working order of all working equipment including slings, crates, baskets, boxes, chutes, mattresses, and tackle.

(b) Any and all equipment, which in the judgment of the master or other person in charge of the vessel is not adequate or in safe working condition shall be rejected by him and he shall prohibit its use and shall take such precautions as he may deem necessary to be certain such rejected equipment is not used for the purpose of loading or unloading explosives. The master or other person in charge of the vessel shall keep watch of all equipment used during the transfer of explosives and if any part of the equipment shows any defect or is damaged in use, work shall be stopped and the damaged or defective equipment repaired or replaced before permitting the loading or unloading to continue.

(c) This inspection of cargo working equipment shall apply to the vessel's equipment and to stevedore's or other contractor's equipment.

(d) The Captain of the Port or his representative may prohibit the use of any cargo working gear or equipment, including stevedore equipment, which he deems unsafe.

§ 146.29-35 Lights, tools, and portable equipment. (a) No artificial lights except electric lights, electric lamps, or electric floodlights shall be used while loading or unloading military explosives. Such light fixtures shall not be used unless protected against accidental breakage by metal guards. Portable electric lights shall be fitted with stout guards protecting the bulb. Wires of such lights shall be sound and show no evidence of liability to short circuit. When deemed necessary by the military service concerned with the shipment of the explosives due to the possible presence of explosive dust or vapors in the hold of the ship being worked, all electrical equipment and light fixtures used therein shall be of a type approved for the hazardous location as defined in the National Electric Code. This equipment shall be grounded and continuity of the grounding system assured by the applicable methods prescribed in the National Electric Code.

(b) Portable lights shall be so installed as to prevent any part of the light or its cable from coming in contact with the deck or the cargo. A hanging portable light shall not be suspended from its cord but shall be fitted with a gantline so installed that no strain is carried by the light cable. No portable light shall be taken into a hold or compartment in which the stowage of ammunition or explosives has been completed without prior approval by the Captain of the Port or his representative. A portable light and light cord that is permitted in a hold shall; be installed in a manner which will prevent the light cord from coming into contact with the ship's metal surfaces; be guarded and protected from damage that may be caused by the ship's working gear or stevedore handling equipment; and shall not be permitted to be in bearing with any of the ammunition, explosives or hazardous munitions or containers thereof.

(c) Flashlights of a non-spark type shall be provided by the vessel owner, agent or its master or other person in charge of the vessel, for personnel required to enter holds in which explosives are stowed.

(d) Members of the crew of the vessel and other persons permitted on board the vessel to aid and assist in loading, unloading or handling military explosives shall not be permitted to carry on their persons firearms, matches, flame producing devices, knives, bale hooks, metallic tools except as provided in paragraph (e) of this section or personal packages of any description, except the prohibition against knives shall not apply to the seaman's knife in possession of a member of the crew of the vessel, provided such crew member is not actually working the explosives or ammunition. Lunch boxes, pails, thermos bottles, other food containers or personal packages of any description shall not be brought on board a vessel unless such items have been examined and passed by the Coast Guard detail. Food containers that are passed on board the vessel shall not be stored in the hold in which explosives are being worked nor shall their contents be eaten in such hold. Persons engaged in handling and stowage of military explosives shall not wear shoes or boots shod or strengthened with iron nail or other spark producing metal unless such footwear is covered with rubber, leather, or other nonsparking material.

(e) The Captain of the Port may authorize the use of pinch bars of ferrous metal in "breaking out" or stowing unfuzed bombs, large caliber separate loading projectiles, and packages of ammunition shipped in heavy unit weight containers. He may also permit the use of saws and hammers that are actually powered by the hand or hand and arm, in the hold of a vessel when necessary in fitting dunnage or constructing a partition or a division bulkhead or installing protection required for the stowage of military explosives. The Captain of the Port may authorize sparkproof electrically powered or pneumatic saws or hammers, but they shall not be used in any compartment containing military explosives. The Captain of the Port or his representative may authorize the use of metallic tools on deck in the vicinity of the hatch for necessary work associated with the loading, such as winch repairs, opening or tightening shackles, etc.: *Provided*, That they are removed from the scene as soon as the work is completed.

(f) All electric wiring in holds in which explosives are to stowed shall be inspected prior to the loading of explosives into the hold. The electrical circuits which terminate in or service holds in which explosives are to be stowed shall be deenergized by removing their fuses or inactivating their circuit breakers at the main panel prior to loading and these circuits shall remain deenergized while explosives are within the hold. The main panel shall be tagged to warn personnel against reenergizing these circuits.

§ 146.29-37 Handling drafts of lumber. All lumber in excess of 3 feet in length shall be handled into or out of the holds of vessels loading, unloading or containing military explosives or ammunition by

use of a double sling. Small pieces of lumber used in chocking and dunnaging shall be handled in trays with sideboards. Cargo nets may also be used provided they are lined with canvas or similar fabric. Dunnage shall not be lowered directly onto stowages of ammunition or explosives. Landing mats or timbers shall be laid to receive such drafts.

§ 146.29-39 Handling and slinging of explosives. (a) All military explosives or chemical warfare agents in bulk shall be handled carefully. Packages and other containers shall not be dropped, dragged, tumbled, walked, slid over each other or over the deck or otherwise subjected to shock except that heavy containers of military explosives equipped with pulling bar assemblies and skids may be positioned in the holds of vessels by using the pulling bar assemblies to maneuver the containers for short distances at slow speed. Packages and other containers shall not be rolled unless rolling is specifically permitted by the provisions governing handling as set forth in § 146.29-100.

(b) In transferring military explosives between pier facilities and vessels or from vessel to vessel, or within the hold of a vessel the items may be handled by hand, power operated mechanical hoist or power operated conveyor approved by the Captain of the Port, power operated cargo lift truck, hand truck or nonpowered (gravity) roller conveyor (hand controlled); or unless specifically prohibited by the regulations in this subpart, a specification chute and mattress may be used. (Refer to §§ 146.09-11 and 146.09-12 for specifications of chute and mattress.)

(c) Classes III, VI, VIII, and IX-C shall be lowered carefully onto a mattress or other shock absorbing material.

(d) The Captain of the Port may permit the use of cargo-handling vehicles or equipment powered by internal combustion engines on docks, wharves or piers for the handling of military explosives under such conditions as he may prescribe. Such type vehicles or equipment shall not be used within a hatch of a vessel having military explosives in any hold within said hatch. Electric or battery powered vehicles or equipment of explosion-proof or spark-proof type such as approved power-operated industrial trucks with recognized testing laboratory designations of "EE" and "EX" may be used to handle military explosives on docks, wharves, piers or in the holds of vessels under such conditions as the Captain of the Port may prescribe. All power-operated cargo-handling vehicles or equipment shall at all times be maintained in safe mechanical, electrical and operating condition. The use of cargo-handling vehicles or equipment may be suspended or prohibited by the Captain of the Port or his representative when he considers such use inimical to safety.

(e) When handling, loading or unloading by mechanical means, all military explosives shall be handled in the type equipment specified for the various classes of explosives in § 146.29-100. Military explosives shall be arranged on trays so that no portion of the military explosives or containers overhangs the tray. For trays provided with sideboards, military explosives or containers shall not extend above the sideboards to a height exceeding one-third of the vertical dimension of the item as stowed on the tray. Rope net slings with pie-plates, pallet, skipboard or similar base shall be so loaded that when lifted a minimum displacement of items shall occur and the cargo net shall completely encompass the entire load except on its topside.

(f) The mesh of a cargo net shall be of such size as will prevent any item or container of military explosives in the draft from passing through the mesh under any possible circumstances.

(g) Drafts shall not be raised or stopped in lowering by sudden application of power or brake. Drafts shall not be unloaded by tripping or freeing one side of the net, tray, or pallet and tumbling the ammunition or explosives out of the gear. All drafts, beams, shackles, bridles, slings, hooks, etc., shall be hand freed before the winch takes control. Slings shall not be disengaged by hand unhooking and then dragged from under draft by means of winch except for the topmost layer in the hold when power removal is the only possible method and when the cargo cannot be toppled. Handles or beckets on ammunition packages shall not be used for slinging purposes.

(h) Blasting caps, detonators, primer-detonators, fulminate of mercury and initiating or priming explosives as defined in the regulations in this part shall be considered as constituting a distinct class of dangerous explosives, and because of the hazard involved they shall be handled with extreme care.

(i) [Reserved]

(j) "Cant" or barrel hooks shall not be used for raising or lowering a barrel, drum, depth bomb, depth charge or other container of military explosives. Metal bale hooks shall not be used in handling packages of explosives.

(k) Combination woven rope and wire slings are not permitted for use in handling explosives. A sling that is formed by use of an open hook shall not be used in hoisting or lowering a draft of military explosives.

(l) Wire rope or wire rope assemblies including splices or fittings thereof, used in handling military explosives shall be kept bare to permit ready inspection of its safe working condition. Mechanical type endings may be used in lieu of hand splices provided such endings have a minimum breaking strength equal to the catalog strength of wire rope from which it is made.

(m) Bombs shall not be handled by the lifting lug or suspension lugs.

(n) Only safety hooks or hooks that have been moused by wire shall be utilized in loading or discharging drafts of military explosives or munitions.

§ 146.29-41 Weight per draft. To eliminate excessive draft, slings will be as short as practicable when handling military ammunition or explosives. The maximum permitted weight per draft of all classes of military explosives shall be as follows for a 5-ton boom. The weights per draft may be increased proportionately for booms of greater capacity. In all instances the allowance shall remain as 10 percent. For example, in paragraph (d)(2) of this section, the maximum weight of drafts consisting of one or more palletized units of Class V or VII military explosives shall not exceed 4,400 pounds when using a five ton boom; however, if a ten ton boom is used the weight of the draft may be increased to 8,800 pounds (8,000 pounds plus 10 percent of same).

(a) **Class I.** (1) When handled by pallet, skipboard, or tray fitted with cargo net or sideboards shall not exceed 3,000 pounds plus 10 percent.

(2) Drafts consisting of one or more palletized units shall not exceed 4,000 pounds plus 10 percent.

(b) **Classes II-A, II-B, II-C, II-D, II-E, II-F, II-G, II-H, II-J, IV, IX-A, IV-B.** (1) When handled by pallet, skipboard, tray, or pieplate fitted with cargo net or sideboards shall not exceed 2,400 pounds plus 10 percent.

(2) Drafts consisting of one or more palletized units shall not exceed 4,000 pounds plus 10 percent.

(c) **Classes III, VI.** (1) When handled by tray fitted with sideboards shall not exceed 2,400 pounds plus 10 percent.

(2) Drafts consisting of one or more palletized units shall not exceed 4,000 pounds plus 10 percent.

(d) **Classes V, VII.** (1) When handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 pounds plus 10 percent.

(2) Drafts consisting of one or more palletized units shall not exceed 4,000 pounds plus 10 percent.

(3) Single shells weighing in excess of 2,200 pounds must be loaded or unloaded one at a time.

(e) **Class VIII.** (1) When handled by tray fitted with sideboards shall not exceed 1,000 pounds plus 10 percent.

(2) Drafts consisting of one or more palletized units shall not exceed 2,400 pounds plus 10 percent.

(3) The maximum permitted weight for lift of a portable magazine containing Class VIII ammunition shall not exceed 2,400 pounds plus 10 percent.

(f) **Class IX-C.** (1) When handled by tray fitted with sideboards shall not exceed 1,000 pounds plus 10 percent.

(2) the maximum permitted weight for purpose of lift of a portable magazine containing IX-C explosives shall not exceed 2,400 pounds plus 10 percent.

(g) **Classes X-A, X-B, X-C, X-D.** (1) When handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 pounds plus 10 percent.

(2) When handling bombs, more than one to a draft, by sling method or in palletized units, the draft shall not exceed 4,000 pounds plus 10 percent.

(3) Table of limiting loads applicable when handling bombs by sling method:

Weight of individual bomb or cluster.	Maximum limits in units per draft
1 pound to 250 pounds plus 10 percent per unit	8
276 to 500 pounds plus 10 percent per unit	6
551 to 1,000 pounds plus 10 percent per unit	4
1,101 to 2,000 pounds plus 10 percent per unit	2
Over 2,200 pounds	1

(4) Single items or assembled units (other than palletized), designed to be handled as a unit, may be loaded regardless of weight provided the cargo handling gear is of a design capable of handling a working load at least 50 percent additional to the actual weight of the item or unit comprising the draft, and provided further the integrity of the cargo handling gear is unimpaired.

(h) **Classes XI-A, XI-B, XI-C, XI-D.** (1) When handled by trays, skipboards, pallets or pieplates fitted with cargo nets or sideboards shall not exceed 2,400 pounds plus 10 percent.

(2) Drafts consisting of one or more palletized units shall not exceed 4,000 pounds plus 10 percent.

(3) Single bombs or other unit containers weighing in excess of 2,200 pounds must be loaded or unloaded one at a time.

(i) [Reserved]

(j) A tray with a top and so constructed that it may be considered equivalent to a palletized unit may, subject to the approval of the Captain of the Port, be permitted a maximum weight per draft of 4,000 pounds plus 10 percent. This top may be constructed of other material than the tray, provided it serves to make the tray an integral unit.

§ 146.29-42 Containers of ammunition. Containers or portable magazines containing explosives of Coast Guard Classes I and II, designed to be loaded and discharged in a loaded condition by "lift-on, lift-off" method may be handled regardless of weight provided the rated working capacity of the cargo handling gear is not exceeded and

provided further that the integrity of the handling gear is unimpaired. The volume of explosives that may be stowed in a container is not limited unless the container is being used as a portable magazine as described in §146.29-69. Where the regulations of this subpart require magazines, containers may not be used for stowage purposes unless they comply with magazine requirements. All other classes of military explosives may be carried in containers on approval of the Commandant.

§ 146.29-43 Requirement for the opening of hatches. (a) **Vessels at explosives loading piers or at ammunition loading piers.** (1) A weather deck hatch through which ammunition or explosives are being worked shall have sufficient hatch covers and hatch beams removed across the entire width of the hatch so that the resulting opening, measured parallel to the side of the vessel, is at least equal to twice the longest axis of the largest draft being loaded.

(2) Strongbacks or hatch beams left in place shall be firmly secured by hatch battens or other approved means.

(b) **Vessels at explosives anchorages.** A weather deck hatch through which ammunition or explosives are being worked shall have all hatch covers and all hatch beams removed unless otherwise authorized by the Captain of the Port.

(c) **Vessels at explosives anchorages having a magazine constructed in the square of a weather deck hatch.** Sufficient hatch covers and hatch beams shall be removed from the weather deck hatch to expose the entire magazine.

(d) **General requirements.** (1) During the working of ammunition and explosives to or from the deep holds, the 'tween-deck hatch openings shall at all times be equal to, if not greater than, the weather deck hatch openings.

(2) The use of open hooks in removing or replacing hatch beams or hatch strongbacks is prohibited. Closed hooks, shackles or T bars shall be used in this operation.

§ 146.29-45 Loading or unloading military explosives and other cargo. (a) Military explosives shall not be loaded or unloaded in a hatch at the same time that other cargo is being worked in any of the holds serviced through said hatch.

(b) Military explosives shall not be loaded or unloaded from the same hatch from both sides of the ship simultaneously, unless the hatch is fitted with cargo handling gear located at both the forward and after ends of the hatch. A vessel so equipped may also use both sets of cargo handling gear simultaneously from the same side of the vessel.

(c) When military explosives are stowed in a hold below one in which any cargo is being worked the 'tween-deck hatch dividing the two holds will have all of its covers securely in place.

(d) Military explosives may be loaded in a hold before or after other cargo, provided that all precautions are taken to assure full protection to the explosives against the hazard of articles being dropped from the cargo sling. When possible hatches should be partially covered to assure such protection.

(e) Drafts of any kind shall not be handled over explosives or other dangerous articles that are stowed "On deck".

(f) Any deck loads over which military explosives must be passed shall be limited in height to that of the hatch coaming, bulwark, or three feet, whichever is greater.

(g) Drafts of explosives may not be handled over explosives or other dangerous articles which have been placed on deck permanently or temporarily.

§ 146.29-47 Packing and marking. Military explosives shall not be offered to vessels or accepted by vessels subject to the regulations in this part unless they are in proper condition for transportation and are packed, marked, labeled, described, certified and otherwise acceptable in accordance with the applicable provisions of the regulations in this part.

§ 146.29-49 Stowage on board barges. (a) Barges subject to the regulations in this part, engaged in the transfer of explosives between receiving points and delivery points within the harbors, bays, sounds, lakes, and rivers, including the explosives anchorages on the navigable waters, shall conform to the applicable provisions of 49 CFR §§176.95 through 176.99. Ammunition or explosives in bulk, in combustible outside packages, stowed "On deck in open" shall after loading and during transportation be covered by fire resistant and or flame proof tarpaulins securely lashed in place.

(b) Notwithstanding the requirements of this subpart relative to the stowage of detonators, blasting caps and fuzes, Class VIII, such articles may be stowed "On deck" on Class AA and Class AB barges with other ammunition or explosives in bulk stowed thereon, provided a sandbag barrier of at least 2 feet in thickness intervenes between the ammunition or explosives in bulk and the detonators, blasting caps or fuzes. When both are stowed "On deck" the height of this barrier shall be at least equal to the height of the stowage of the detonators, blasting caps or fuzes, or the ammunition or explosives in bulk, whichever is highest. The barrier shall either completely surround the detonators, blasting caps or fuzes or extend across with width of the barge. With this type of barrier no additional separation is required. For Class AC barges, the stowage of detonators, blasting caps or fuzes, Class VIII, shall, when no permanent steel bulkhead intervenes, be separated from the stowage of ammunition or explosives in bulk by a distance of 40 feet; with a permanent steel bulkhead intervening, detonators, blasting caps or fuzes shall be separated from the stowage of explosives in bulk by a distance of 25 feet and from the stowage of ammunition by a distance of 10 feet. If, under deck, a 2-foot sandbag barrier is utilized to intervene between the stowage of ammunition or explosives in bulk, it shall be considered as though a permanent steel bulkhead or deck intervenes. Notwithstanding the provisions of 49 CFR §176.93, Class CA and Class CB barges may transport ammunition on deck.

§ 146.29-51 Stowage on board vessels. (a) All articles of cargo classified as military explosives by the regulations in this subpart shall be stowed on board a vessel in conformity with the provisions of the regulations in this subpart.

(b) Mixed stowage of ammunition or explosives in bulk with other ammunition or explosives, or other dangerous articles or substances, or combustible liquids or hazardous articles shall be in conformity with the provisions of the explosives and hazardous munitions admixture charts, §146.29-99, the classification, handling and stowage chart §146.29-100 and other applicable specific provisions of this subpart. A military explosive or hazardous munition shall not be stowed in the same van or cargo transporter with any other explosive or dangerous article with which it is incompatible according to the regulations in this part. Stowage of vans containing military explosives and hazardous munitions shall follow the compatibility requirements of §§146.29-99 and 146.29-100.

(c) Specifications governing construction and location of magazines and lockers and the preparation of cargo compartments to be used in the stowage of military ammunition are detailed in §§146.29-71 to 146.29-95, inclusive.

§ 146.29-53 Stowage of military explosives in holds containing coal. Unless expressly authorized by the Commandant of the Coast Guard military explosives shall not be stowed in a hold containing coal as cargo nor in any hold above, below or adjacent to one containing coal.

§ 146.29-55 Stowage of military explosives in holds containing household or personal effects and/or mail as cargo. (a) Unless expressly authorized by the Commandant of the Coast Guard, military explosives shall not be stowed in a hold containing household or personal effects and/or mail as cargo, nor in the hold above or below the hold containing any of these items.

(b) Military explosives may be stowed in a compartment or hold adjacent to one containing household or personal effects. However, if the explosives are stowed up to or against the intervening permanent bulkhead, a buffer consisting of at least three feet of non-dangerous cargo shall be placed between the household or personal effects or mail and the permanent bulkhead intervening between this stowage and the explosives. If non-dangerous cargo is not available for this purpose, a division bulkhead shall be erected to provide an air space of at least one foot wide between the household or personal effects, or mail, and the intervening permanent bulkhead.

(c) This section shall not apply to vessels having on board military explosives of Coast Guard Class I category only.

§ 146.29-57 "On deck" stowage. (a) Articles classified as military explosives, the stowage of which is permitted "On deck" by the regulations in this subpart shall be properly secured. Such security may be obtained by using existing vessels structures such as bulwarks, hatch coamings, shelter deck and poop bulkheads, as part boundaries and effectively closing in the cargo by fitting angle bar closing means, secured by bolting to clips or other parts of the ship's structure. Lashing of deck stowage permitted provided eye pads are fitted to carry such lashings. Guard rails shall not be used to secure such lashings.

(b) Bulky articles may be secured by lashing with individual wire rope lashings or other equally efficient means.

(c) Shoring of such bulky articles of cargo shall be in addition to the foregoing means of securing.

(d) Military explosives stowed "On deck" shall not be stowed within a distance of 20 feet of an incinerator, the topside terminus of an ash hoist or a coal or oil fire gallery or bake shop. For vessels fitted with electrically operated galleys and bake shops, the military explosives stowed on deck may be stowed not closer than 10 feet of such galleys and bake shop provided no incinerator or topside terminus ash hoist is within a distance of 20 feet of such stowage.

(e) Deck boxes, portable magazines, containers or cargo transporters containing military explosives shall meet the requirements of this section when stowed "On deck." Compatibility of the explosives within the deck box, portable magazine, cargo transporters or containers shall be in accordance with §§146.29-99 and 146.29-100. A deck box, portable magazine, container or cargo transporter containing military explosives shall be separated from other deck boxes, portable magazines, containers or cargo transporter containing explosives of incompatible classes by the superstructure or, if the height of the container does not exceed that of the hatch coaming, by the weather deck hatch.

Fire plugs, sounding pipes and access ways shall be maintained free and clear.

§ 146.29-59 Stowage adjacent to other dangerous articles. As noted in § 146.29-11, missile and rocket fuels or oxidizers listed in Classes XI-C and XI-D of § 146.29-100 are excluded from the provisions of this section when shipped with military explosives, and compatibility will be in accordance with the chart in § 146.29-99.

(a) **Flammable liquids.** (1) Military explosives shall not be stowed in the same hold, nor in any hold below, any hold above or a hold adjacent to one in which flammable liquids are stowed. Military vehicles including ducks, buffaloes, alligators and similar amphibious types of craft, referred to in this subpart as "vehicles" or "military vehicles", using a flammable liquid as fuel may be stowed in holds adjacent to a hold in which military explosives are stowed provided the fuel is confined to the vehicle's tank and is not in excess of approximately 75 percent of the capacity of the fuel tank.

(2) Military vehicles, landing craft and small boats using flammable liquid as fuel and having the fuel confined to the vehicle's or boat's tank and not in excess of approximately 75 percent of the capacity of said tank may be stowed "On deck" over a hold in which military explosives are stowed. *Provided*, That the weather deck is tight and the cargo hatch is fitted with a tight raised coaming and that such stowage is not made over the square of the hatch, except that amphibious type vehicles, landing craft or boats having fuel tanks installed within a tight hull may be stowed over the square of a hatch.

(3) Flammable liquids as cargo shall not be stowed "On deck" immediately above a hold in which military explosives are stowed. The applicable provisions of 49 CFR Part 176, shall be observed in the stowage of flammable liquids "On deck".

(b) **Flammable solids or oxidizing materials.** (1) Military explosives shall not be stowed in the same hold nor in any hold above or below or a hold adjacent to one in which flammable solids, oxidizing materials, or organic peroxides are stowed except as specifically authorized by the provisions of § 146.29-100.

(2) Flammable solids, oxidizing materials, or organic peroxides may be stowed "On deck" over a hold in which military explosives are stowed: *Provided*, That the weather deck is tight and the cargo hatch is fitted with a tight raised coaming and such stowage is accomplished by means of a crib and platform so constructed as to provide a free space of at least 6 inches in height between the deck and the floor of the crib in such a manner as to allow flushing of any leakage that may occur: *And provided further*, That such stowage is not made over the square of the hatch.

(c) **Corrosive materials.** (1) Military explosives shall not be stowed in the same hold nor in the hold below one in which corrosive materials are stowed except as specifically authorized by the provisions of § 146.29-100. Corrosive material's may be stowed "On deck" over a hold in which military explosives are stowed: *Provided*, That the weather deck is tight and the cargo hatch is fitted with a right raised coaming and such stowage is accomplished by means of a crib and a platform so constructed as to provide a free space of at least 6 inches in height between the deck and the floor of the crib in such a manner as to allow flushing of any leakage that may occur: *And further provided*, That such stowage is not made over the square of the hatch.

(2) The substances listed below shall not be transported on board a vessel which is carrying in excess of 100 tons of ammunition or explosives:

Acid sludge
Bromine
Chloracetyl chloride
Dimethyl sulfate
Hydrofluoric acid, anhydrous
Nitrating (mixed) acid
Nitric acid
Phosphorus oxychloride
Phosphorus tribromide
Phosphorus trichloride
Spent acid (sulfuric or mixed)
Sulfur chloride

(d) **Military vehicles and privately owned vehicles shipped by, for, or to the United States Department of Defense with electrolyte.** Notwithstanding the provisions of 49 CFR Part 176, electrolyte of not over 47 percent strength (39° Baume) may be accepted for transportation and be stowed on board vessels carrying military explosives under the following conditions of packing:

(1) In glass or earthenware containers, not exceeding 160 ounces capacity (one imperial gallon) in fiberboard cartons of a size to permit cushioning with an incombustible, absorbent material of a sufficient amount to absorb the contents of the container in event of breakage. The outside container shall consist of a wooden box (DOT-15A, 16B or Army Specification) in which 1, 2, 3, or 4 fiberboard cartons may be packed. Battery electrolyte may also be shipped in one-gallon polyethylene bottles made and packaged in accordance with Military Specification 207B, Type IV, Class II. The outside containers shall carry the white (acid) label. No military ammunition shall be included within this package.

(2) Electrolyte packed in accordance with provisions set forth in subparagraph (1) of this paragraph may be stowed:

(i) "On deck in open" including deck areas over holds containing military explosives.

(ii) "Tween-deck" or "Under deck" in holds adjacent to or in any hold below a hold containing military explosives.

(3) Electrolyte, when packed in accordance with the provisions of subparagraph (1) of this paragraph, may be accepted for transportation when securely fastened within or on a military vehicle or other military equipment whether such vehicle or equipment is shipped crated, boxed, or without crating or boxing. Such military vehicles or military equipment, when shipped crated or boxed, may be accepted for transportation when the container of electrolyte is securely fastened on the inside of the shipping crate or box containing the vehicle or military equipment. When so shipped, the overall crate or box shall carry the white (acid) label and shall be marked "This side up" and "Inside packages comply with prescribed specifications."

(4) Electrolyte packed in accordance with the provisions of subparagraph (1) of this paragraph when offered for transportation under the conditions set forth in subparagraph (3) of this paragraph, may be stowed as follows:

(i) "On deck in open", including deck areas over holds containing military explosives;

(ii) "Tween-deck" or "Under deck" in holds adjacent, any hold below or any hold above holds containing military explosives; or,

(iii) In the same hold containing Class I, IV, V, VII, X-A, X-B, X-C, or X-D, provided the stowage of military vehicles and the stowage of ammunition are separated by a division bulkhead or a 2-inch dunnage floor.

(5) Military vehicles and privately owned vehicles shipped by, for, or to the United States Department of Defense (crated or uncrated) containing an electrolyte storage battery shall not be stowed in the same hold over military explosives stowed therein. Such vehicles may be stowed in the same hold under or alongside of military explosives stowed therein: *Provided*, That all the applicable provisions of this section and section 146.29-61 are observed: *And provided further*, That the vehicles are processed, the fuel tank drained dry, the battery terminal leads disconnected, taped and protected against short circuit.

(6) Military vehicles or military equipment as used in this section includes naval vehicles or naval equipment.

(e) **Flammable compressed gases.** (1) Military explosives shall not be stowed in the same hold nor in any hold below, any hold above or a hold adjacent to one in which flammable compressed gases are stowed.

(2) Flammable compressed gases shall not be stowed "On deck" over a hold in which any Class II-A, II-C, II-D, II-E, II-G, V, VI, VII, VIII, IX-A, IX-B, IX-C, X-A, X-B, X-C, X-D, XI-A, XI-B, or XI C is stowed.

(3) Flammable compressed gases may be stowed "On deck" over a hold in which Class I, II-B, II-F, II-J, III, or IV is stowed: *Provided*, That, the weather deck is tight and the cargo hatch is fitted with a tight raised coaming, and such stowage is accomplished by means of skids at least 6 inches in height off the deck or a crib and platform so constructed as to provide a free space of at least 6 inches in height between the deck and the floor of the crib. Other applicable provisions of §§ 146.24-1 to 146.24-100, inclusive, shall be observed. Stowage may be over the square of the hatch.

(f) **Non-flammable compressed gases.** Ammunition of the following Classes I, II-B, II-G, IV, V, and VII may be stowed in the same hold or compartment with non-flammable compressed gases provided the two stowages are separated by a type "A" dunnage floor or a division bulkhead. This mixed stowage is not permitted for the following non-flammable gases: Boron trifluoride, chlorine, oxygen and sulphur dioxide.

(g) **Poisons.** (1) **Class "A".** Classes I and II-F ammunition may be stowed in the same hold or compartment with Class "A" poisons provided the two stowages are separated by a type "A" dunnage floor or a division bulkhead.

(2) **Class "B".** Ammunition of the following classes, I, II-B, II-F, IV, V, VII, XI-A and XI-B may be stowed in the same hold or compartment with class "B" poisons: *Provided*, That the two stowages are separated by a type "A" dunnage floor or a division bulkhead.

(3) **Irritating materials.** Ammunition of the following classes I, II-B, II-F, II-G, IV, V, VII, XI-A, and XI-B may be stowed in the same hold or compartment with irritating materials: *Provided*, That the two stowages are separated by a type "A" dunnage floor or a division bulkhead. Class II-A, propellant charges, may also be stowed in the same hold with irritating materials: *Provided*, That the two stowages are separated by a type "A" dunnage floor or a division bulkhead: *And provided further*, That the Class II-A, propellant charges, ammunition is given top stowage.

(h) **Other regulated materials (ORM).** Military explosives shall not be stowed in the same hold or in the hold below, the hold above or a hold adjacent to one in which other regulated materials (ORM) are stowed.

(i) **Radioactive materials.** Military explosives may not be stowed in the same hold in which radioactive materials are stowed.

(j) **Combustible liquids.** (1) Military explosives shall not be stowed in the same hold nor in the hold below one in which combustible liquids are stowed.

(2) Combustible liquids may be stowed "On deck" over a hold in which military explosives are stowed: *Provided*, That the weather deck is

tight and the cargo hatch is fitted with a tight raised coaming and such stowage is accomplished by means of a crib and a platform so constructed as to provide a free space of at least 6 inches in height between the deck and the floor of the crib in such a manner as to allow flushing of any leakage that may occur. *And provided further,* That such stowage is not made over the square of a hatch.

(h) "On deck" stowage. When packages of flammable liquids, flammable solids, oxidizing materials, or organic peroxides, corrosive materials, compressed gases, poisons, radioactive materials, combustible liquids, or other regulated materials (ORM) are stowed "On deck," such packages shall not be stowed within 12 inches of any steam pipe fitted on deck.

§ 146.29-61 Stowage with nondangerous cargo in the same hold. (a) Military explosives that are stowed in the same hold with nondangerous cargo shall be protected from damage likely to be caused by heavy nondangerous cargo. Shafting, steel bar, steel shapes, pipe, heavy machinery, vehicles (uncrated), and similar types of cargo shall, when stowed in the same hold with military explosives, be so isolated or dunnaged or secured as to prevent damage to military explosives or magazines containing said substances, or temporary bulkheads protecting explosive stowages, under any conditions likely to be encountered during the voyage.

(b) When nondangerous cargo is to be stowed adjacent of the exterior of a magazine, wooden cargo battens of not less than commercial 2" x 4" size spaced not more than 12 inches, center to center, shall be fitted horizontally to the uprights forming the frame of the magazine.

§ 146.29-63 Stowage and dunnaging of ammunition and containers of explosives in bulk. (a) Military explosives shall be so stowed and dunnaged as to prevent damage to the cargo or the vessel from shifting cargo caused by forces incident to the voyage of the vessel. Nothing within this paragraph shall be construed as requiring the entire interior of the cargo compartment to be covered with dunnage.

(b) Containers of military explosives marked, "This side up" or otherwise marked directing their stowage shall be so stowed.

(c) Kegs of black powder shall be stowed in an upright position, the bungs or other filling openings "up". Each tier shall be floored off.

(d) Metal containers or metal tanks or other containers of propellant charges having closure means which protrude beyond the chime or the surface of the container shall be so dunnaged as to prevent damage occurring to such closures.

(e) The uppermost tier of military explosives shall be so secured to the mutual satisfaction of the Captain of the Port and the Master of the vessel by tomming, bracing, strapping, top stowing with permissible cargo of sufficient unit weight and quantity or other effective means that no displacement can occur either upwardly or laterally.

(f) Military explosives shall be so stowed that they or the containers are not liable to be pierced by the dunnaging or crushed by superimposed weight.

(g) Containers of military explosives shall not be "cant" stowed. They shall be stowed in full bearing on dunnage or both end and center bearing on dunnage. Broken stowage may at the turn of the bilge, be dunnaged out with cordwood or otherwise so cribbed as to provide maximum bearing attainable for the container to be stowed in the tier above. Broken stowage in other locations in the hold may be compensated for by cribbing out or by the insertion of sufficient dunnage to provide proper bearing for packages in the tier above.

(h) Fixed or semifixed ammunition in fiber containers, crated or uncrated, may be stowed on its base or on its side. Dunnaging shall be accomplished in such manner as to bear only upon the metal part of the container. No dunnage or weight shall bear directly upon the fiber portion of the container.

(i) [Reserved]

(j) Separate-loading projectiles boxed, crated, unboxed, or uncrated may be stowed on their bases or on their sides except as otherwise provided for Army WP filled ammunition in the stowage requirements for Class II-D ammunition, § 146.29-100.

(k) When tween-deck holds of cargo vessels are utilized for the stowage of military explosives, the maximum permissible deck load for such tween decks shall not be in excess of 45 pounds per square foot of tween-deck space for each foot of tween-deck height, except where the deck and hatch structure of ships have been specially designed or reinforced for the carriage of heavy loads the Captain of the Port may permit loading in accordance with these schedules of increased intensity of loading when they are furnished by the master or operator.

§ 146.29-65 Damaged or leaking containers of explosives. (a) Any container of explosives or chemical warfare agents showing evidence of failure, leaking of a liquid ingredient or inability to retain its contents shall not be accepted for transportation, storage, or stowage on board any vessel.

(b) Any container of an explosive when offered for transportation, storage, or stowage, showing excessive dampness or which is moldy or shows outward signs of any oil stain or other indications that absorption of the liquid part of the explosive is not perfect, or that the amount of the liquid part of the explosive is greater than the absorbent can carry, shall not be accepted for transportation. The shipper must substantiate any claim that a stain is due to accidental contact with grease, oil, or similar substances. In case of doubt the container shall be refused.

§ 146.29-67 Defective ammunition. Ammunition found to be defective while being unloaded from a barge, freight car, or other vehicle, shall not be placed on board a vessel. If found to be defective while on board the vessel, it shall, if at all possible, be removed from the vessel to an isolated location as quickly as possible.

§ 146.29-69 Recoopering damaged packages. Defective packages shall not be recoopered in the hold of a vessel. Such packages shall not be recoopered elsewhere on board the vessel except upon conditions authorized by the Captain of the Port. Replacing bomb shipping bands, loose covers, nose plugs or strapping containers is not classed as recoopering.

§ 146.29-71 Constructing magazines. (a) All work in connection with the construction of a magazine, or other conditioning of holds, decks, or hatches shall be completed before the actual loading of military explosives is undertaken except as provided in §§ 146.29-35(e) and 146.29-81(b). Magazine construction or other conditioning of a hold in which military explosives are not actually being loaded or which do not contain any military explosives is permitted.

(b) Sizes of material used for the construction of a magazine or other conditioning of holds, decks, or hatches, as set forth in the regulations in this subpart, are minimum. Increased sizes may be used, if desired. Nails shall not protrude beyond the surface of the lumber or other material authorized.

§ 146.29-73 Preparation of magazines, decks, hatches and holds for handling military explosives. (a) All magazines and holds shall be cleared of all rubbish and discarded dunnage and be swept, hosed down or cleaned by such other efficient method that will insure the compartment to be broom clean and free of any residue from cargo before commencing to load any military explosives. Bilges, overhead deckbeams and strongbacks shall be examined and any residue of previous cargo removed therefrom.

(b) All decks, gangways, and hatches over or through which military explosives must be passed or handled in loading or unloading shall be freed of all loose material and shall be swept broom clean both before and after loading or unloading.

(c) The hatches or cargo ports opening into a compartment in which military explosives are stowed shall be kept closed at all times except during the operation of loading or unloading of the compartments or during periods of short duration for such as lunchbreaks and railcar and truck switching or between shifts on a two- or three-shift daily operation. During the period of such stoppages the hold shall be protected as prescribed by the Captain of the Port. Hatches covered with wooden covers shall be securely closed with tarpaulins.

(d) No debris of any description which creates a fire hazard or a hazardous condition for persons engaged in the explosives handling operation shall be permitted to stand on the weather deck of a vessel while military explosives are being worked.

(e) (1) Hatch beams and hatch covers shall, where possible, be stowed on the opposite side of the hatch from that over which the military explosives are being worked. If this is impossible, they may be stowed on the working side of the hatch.

(2) Hatch beams shall be stowed or secured in a manner that will prevent them from rolling, rocking, turning or sliding.

(3) Hatch covers shall be so stowed as to form as level a platform as possible.

(f) During the time a hatch is open and military explosives are being worked or stowed, the vessel's officer on duty supervising the handling of explosives shall warn the masters of other vessels coming alongside and the operator of any dock equipment (capable of producing sparks) to stay clear of the area adjacent to open hatches as far as practicable.

§ 146.29-75 Location of magazines and ammunition stowage. (a) A cool location being an important factor, magazines shall be built and military explosives stowed in an authorized location in accordance with the following factors in the order listed. The Captain of the Port may authorize in his discretion a modification of the below established location priorities when circumstances so justify:

(1) A tween-deck hold, preferably a lower tween-deck.
(2) A lower hold.
(3) In the square of a hatch.
(4) A shelter deck in a location as far removed from uptakes or engine casing as possible.
(5) A forecastle, poop or permanent deck house provided the space is ventilated and does not contain any "in use" crew accommodations, nor vessel stores, and can be closed off from traffic while at sea.
(6) "On deck" stowage.
(7) Insulated spaces normally comprising refrigerator spaces may be used for the stowage of all classes of military explosives, except Class II-J chemical ammunition: *Provided,* That all regulations relative to stowage of explosives with other dangerous articles of cargo are observed and the spaces may be ventilated sufficiently to provide a temperature consistent with the temperature of other holds of the vessel. When such

For explanation of abbreviations and reference marks, see last page of this tariff.

spaces are fully ceiled, the entire compartment will be considered as a magazine, however, any pipes within the compartment shall be protected by horizontal cargo battens of a size not less than commercial 2" × 4", spaced not more than 12 inches apart, center to center and secured to 4" × 6" uprights spaced not more than 36 inches apart. Refrigerator spaces, the floors of which are lined with lead, shall not be used as a stowage for picric acid in bulk or ammonium picrate.

(b) When it is necessary to construct a magazine or to stow ammunition adjacent to the engine room, boiler room or coal bunker bulkheads, or the engine or boiler room uptakes or casings, the following provisions shall be complied with except in the stowage of small arms ammunition without explosive bullets:

(1) A tight wooden temporary bulkhead shall be constructed at least one foot off the permanent bulkheads, uptakes or casings with the smooth side facing the stowage of the explosives or ammunition.

(2) When the permanent bulkhead is smooth on the cargo side, construction shall be of commercial 2-inch boarding secured to uprights of 4" × 6" size spaced not more than 30 inches apart in the 'tween or shelter deck, or 6" × 6" size spaced not more than 24 inches apart in the lower hold. Uprights shall not be stepped directly onto a metal deck or overhead. A 2" × 6" bearer to carry the upright shall be laid on the metal deck, and a 2" × 6" header shall be fitted against the underside of the overhead deck to receive the top of uprights. Top of uprights fitted against overhead deck beams may be wedged direct to the beam with 2" × 4" spacers fitted between. Suitable horizontal stringers shall be fitted between temporary and permanent bulkhead at the top and bottom, as well as intermediate stringers spaced a maximum of 5 feet. Uprights shall be securely fastened to horizontal stringers or horizontally braced at the top, bottom and center.

(3) When the permanent bulkhead stiffeners are on the cargo side, suitable uprights of not less than 2" × 4" may be installed against the permanent vertical stiffeners to give the required 12 inches off the bulkhead. If the permanent stiffeners are over 30 inches apart, center to center, 2½-inch boarding shall be used. Uprights shall be stepped and braced as required by the provisions of subparagraph (2) of this paragraph. Bulkhead stiffeners that do not extend the full depth of the cargo space shall not be used for this purpose.

(4) Other methods of construction using steel or wooden uprights, bolted to plates or lugs welded to deck beams, decks, or tank tops may be used provided the strength is equivalent to that obtained by the foregoing methods of construction.

(c) Stowage provided for military explosives shall be dry and except for deep tanks well ventilated.

(d) Ammunition as cargo shall not be stowed within a distance of 10 feet of a vessel's radio shack, receiving or transmitting apparatus, radio antenna or antenna lead-in. The same restriction applies to radar equipment.

§ 146.29-77 Allocation of stowage. Military explosives that are tendered to a vessel for transportation as cargo shall be stowed on board the vessel utilizing the type of stowage authorized for the particular ammunition or explosives in bulk by the provisions of § 146.29-100.

§ 146.29-79 Types of stowage. The types of stowage prescribed for military explosives are described as follows:

(a) Magazine stowage A.
(b) Ammunition stowage.
(c) Chemical ammunition stowage.
(d) Special stowage.
(e) Portable magazine stowage.
(f) Pyrotechnic stowage.
(g) Stowage of blasting caps, detonators, primer detonators, etc.
(h) Deck box and van.

§ 146.29-81 Magazine Stowage A. The following shall be observed in the construction of a magazine required by the table in § 146.29-100 for "Magazine A" type of stowage:

(a) Magazines may be constructed of steel or wood.

(b) Magazines constructed of steel shall have the whole of the interior thoroughly protected by wood dunnage of a minimum thickness of ¾ inch. This lining may be installed during the progress of the stowage. Metal stanchions within the magazine shall be boxed with wood of a thickness of not less than ¾ inch. Boxing of portable non-ferrous dunnage system stanchions is not required. Bulkhead stiffeners or other structural members extending into the stowage spaces shall not be protected by dunnaging but shall be completely boarded over. When bare steel decks or tank tops are utilized to form the floor of a magazine, a wooden floor consisting of at least two layers of commercial 1-inch thick dunnaging shall be laid, the top course being laid crosswise to the lower course. When steel decks or tanks tops are originally fitted with a wood flooring or are ceiled, it shall be necessary to fit one course of dunnage. All flooring formed by these methods shall be laid with commercial 1-inch lumber of widths not less than 4 inches, fitted as close as possible, edge to edge and butt to butt.

(c) Magazines constructed of wood shall have the bulkheads forming the sides and ends constructed of commercial 1-inch lumber, of ¾-inch longue and groove sheathing, or of ¾-inch plywood, secured to uprights of at least a 3" × 4" size, spaced not more than 18 inches apart and secured at top, bottom and center with horizontal bracing. When ¾-inch plywood is used, the uprights may be spaced on 24-inch centers. Uprights shall not be stepped directly onto a metal deck. A 2" × 4" bearer to carry the uprights shall be laid upon the metal deck. A 2" × 4" header shall be fitted against the underside of an overhead deck to receive the top of uprights. Top of uprights fitted against channel beams may be wedged directly to the beam with 2" by 4" spacers fitted between. Care shall be taken in securing upright framing that no nails penetrate to the interior of the magazine. When a magazine is constructed as a permanent compartment in the vessel, increased size and finish of lumber and other methods of fastening may be used provided such fastenings are recessed below the surface of the boarding to avoid projections within the interior of the magazine. All boardings shall be fitted and finished so as to form a smooth surface within the interior of the magazine. Construction shall be such as to separate all containers of explosives from contact with metal surfaces of the structure of the vessel. When a metal stanchion, post or other obstruction is located within the interior area of the magazine, such obstruction must be completely covered with wood of a thickness of at least ¾ inch secured in place with nails or screws. When screws are used for fastening, the screwheads shall be countersunk below the surface of the wood. The floor of the magazine shall conform to the provisions of paragraph (b) of this section. The door of the magazine shall be of substantial construction, fitted reasonably tight into its jamb. The door may be secured in place by the use of extension battens and wedges.

(d) A magazine constructed in accordance with the provisions of paragraphs (b) and (c) of this section, in which it is proposed to stow containers of explosives within 12 inches of the overdeck beams, or hatch coaming, shall have such deck beams and coaming sheathed with wood similar to that required for metal stanchions, posts or other obstructions by the provisions of paragraph (c) of this section.

(e) When a Class A magazine measures more than 40 feet in any direction, a partition bulkhead shall be fitted within the magazine as near half length as practicable, extending from the deck to at least the top of the stowage. Such partition bulkhead shall be constructed to the same scantlings as the sides of the magazine, except the boardings may be spaced not more than 6 inches apart alternately on both sides of the uprights. This bulkhead shall be constructed before loading commences and care shall be exercised that nail points do not protrude beyond the surface of the boarding. Such partition bulkheads are not required in magazines using the U.S. Navy nonferrous metal dunnage system.

(f) A magazine constructed in accordance with the provisions of paragraphs (b) and (c) of this section shall comply with the provisions of § 146.29-75(c).

§ 146.29-83 Ammunition stowage. Military explosives that are authorized to be given ammunition stowage by the provisions of § 146.29-100 shall be stowed in a location selected in accordance with the provisions of § 146.29-75. Dunnage shall be laid over metal decks or tank tops, except that dunnage is not required when decks or tank tops are coated with mastic, magnesite, or other equivalent material, and when palletized units are used and the pallets are constructed of wood. Dunnaging shall be fitted to protect packages or articles or military explosives from damage. Nothing within this paragraph shall be construed as requiring the entire interior of the cargo compartment to be covered with dunnage.

§ 146.29-85 Chemical ammunition stowage. Chemical ammunition or chemical agents in bulk that are authorized to be given chemical ammunition stowage by the provisions of § 146.29-100 shall, unless given another authorized stowage, be stowed under the following conditions:

(a) Shall be afforded the same protection as required for ammunition stowage.

(b) Stowage shall preferably be in a deep tank or a lower hold.

(c) When stowed in a deep tank, pump suctions shall be effectively sealed off to prevent the escape of any leakage which may take place. Sealing off shall be accomplished by inserting a blank flange in way of the suction side of the bilge pump manifold.

Note: The blank flange is to prevent inadvertent leaking of chemical agents into occupied spaces through bilge suction piping. Nothing herein shall preclude the removal of the flange in an emergency situation should (in the opinion of the vessel's master) pumping of the deep tank be necessary.

(d) When stowed in a lower hold or other compartment, the hatch covers, ventilators and pump's suction shall be effectively sealed off to prevent the escape of any leakage which may take place. Sealing off the pump's suction shall be accomplished by inserting a blank flange in way of the suction side of the bilge pump manifold.

(e) When the quantity of chemical ammunition or chemical agents in bulk exceeds the capacity of deep tanks and lower holds, other holds may be used, preference being given to other lower holds or to a 'tween-deck hold directly over a lower hold in which such substances are stowed.

(f) Chemical ammunition or containers of chemical agents in bulk stowed in a 'tween-deck shall not be stowed within 8 feet of the side of the vessel.

(g) When the quantity of chemical ammunition to be stowed on board the vessel does not justify the use of a deep tank or lower hold, a suitable tween-deck space may be selected and the ammunition stowed in a portable magazine especially constructed to prevent any leakage from the ammunition escaping outside of the magazine. Such portable magazine shall be located at least 8 feet from the ship's side.

(h) Before entering a deep tank, lower hold or other compartment containing chemical ammunition the air inside the compartment must be tested by competent personnel to ascertain if leakage has taken place. If leakage has occurred, the operation of removing the ammunition or chemical agent shall be conducted by skilled personnel, preferably representatives of the appropriate Department of Defense technical service.

§ 146.29-87 Special stowage. Special stowage may be on deck protected from the elements, in a deck house, mast house, mast locker or in a vacant stateroom: *Provided*, That such a location conforms to the distance separation rule applicable to the item so stowed and adjacent military ammunition: *And provided further*, That the space is ventilated and does not contain any vessel stores or machinery or equipment used during the navigation of the vessel and can be closed off from traffic while at sea. Dunnage shall be fitted to protect packages from damage by contacting any metal parts of the ship.

§ 146.29-89 Portable magazine stowage. Military explosives authorized to be given portable magazine stowage by the provisions of § 146.29-100 shall be stowed under the following conditions:

(a) Shall be located in a hold or on deck in accordance with the provisions of § 146.29-99 and § 146.29-100 for the particular class of military explosive stowed therein. "On deck" stowage shall also meet the requirements of § 146.29-57.

(b) Portable magazines shall be constructed of wood, or of metal lined with wood ¾-inch minimum thickness, and not more than 100 cubic feet plus 10 percent of explosives (gross) shall be stowed therein.

(c) All inner surfaces of the magazine shall be smooth and free of nails, screws, or other projections.

(d) When constructed of wood the scantlings shall not be less than those required for a type "A" magazine in § 146.29-79, and a strong, close fitting hinged cover or door with an effective means of securing shall be provided.

(e) When constructed of metal, the minimum thickness of the metal shall be not less than ⅛-inch sheet, or formed material.

(f) Ammunition or containers of ammunition or explosives in bulk when stowed in a portable magazine shall be so stowed and secured that no displacement can occur either upwardly or laterally.

(g) When stowed on deck the magazine shall be protected from the direct rays of the sun and elements. Runners, bearers, skids, or other suitable means shall be provided to elevate it a minimum of 4 inches from the deck. Pad eyes, ring bolts, or other suitable means shall be provided for lashing the magazines and they shall be so lashed, chocked or braced as to prevent movement in any direction.

(h) Portable magazines shall carry the legend "Inflammable—Keep Lights and Fire Away," or "Flammable—Keep Lights and Fire Away." When used in lieu of ammunition stowage, the legend shall indicate the Coast Guard class or classes of military explosives stowed therein.

§ 146.29-90 Use of cargo transporters (Conex Boxes). Cargo transporters, complying with Military Specifications MIL-B-11886 and MIL-B-21560, may be used for the transportation of military explosives and hazardous munitions subject to the following conditions:

(a) Type I or Type II transporters may be used.

(b) The load content shall not exceed 7800 pounds, equally distributed.

(c) Prior to filling, each transporter is required to be thoroughly inspected by an authorized representative of the shipping activity. Special attention shall be given to the inspection of the corner posts, floor system, and lower eight inches of the side and end panels, doors, and door latches. A record of this inspection shall be maintained by the shipping installation for a period of one year after the shipment leaves the installation or activity.

(d) Lifting shall be accomplished in a manner which will support the floor system. When slings or wire ropes are used, they shall be placed under the container to support the floor system.

(e) The cargo handling gear must be of a design capable of handling a working load at least 50 percent greater than the actual weight of the unit comprising the draft.

(f) The master, owner, charterer, agent or other person in charge of the vessel shall require the shipper or his agent, or the delivering carrier to furnish a copy of the shipper's shipping order, shipping paper, bill of lading, manifest or other memorandum, or a waybill prepared from information furnished in the shipper's shipping order bearing the required certification before accepting cargo transporters containing military explosives or hazardous munitions. This shipping paper shall have entered upon it the proper and definite name and class of the commodity or commodities contained therein according to § 146.29-100, the total quantity by weight, the label applied, if required, and the identification number of the transporter.

(g) Cargo transporters shall carry the legend "Explosives—Keep Lights and Fire Away", or if hazardous munitions are being shipped "Hazardous Munitions—Keep Lights and Fire Away" as well as the Coast Guard class or classes of military explosives or hazardous munitions stowed therein, e.g., "Coast Guard Class II-H." Letters shall be at least three inches high in contrasting color with the background.

(h) The master or other person in charge of the vessel shall assign an officer of the vessel to supervise the acceptance and stowage of the transporters containing military explosives or hazardous munitions. This officer shall examine the transporters for signs of leaking, damage to the containers, or sifting of contents. Any transporter found to be damaged, leaking or sifting shall not be accepted for transportation.

(i) Cargo transporters containing any military explosives or hazardous munitions may be opened by a duly authorized representative of the Coast Guard for inspection to determine compliance with the regulations applicable to such shipments.

§ 146.29-91 Pyrotechnic stowage. (a) Pyrotechnic ammunition shall be afforded ammunition stowage or special stowage in a location away from heat and so protected as to insure no moisture contacting the packages. This class of ammunition shall not be stowed in a hold or compartment with any other military explosives, except as permitted by the admixture charts (§ 146.29-99). Pyrotechnics shall not be overstowed with other cargo.

(b) For limited quantities of pyrotechnic ammunition an alternate stowage may be utilized consisting of stowing in metal lockers or portable magazines so located as to conform with the provisions of paragraph (a) of this section as regards other explosives, over-stowage, heat, and moisture.

§ 146.29-93 Stowage of blasting caps, detonators, primer detonators, etc. Stowage of Classes III, VI and VIII type ammunition shall conform to the provisions of §§ 146.29-99 and 146.29-100, and to the following requirements:

(a) Class VIII ammunition, when stowed on board the same vessel with Classes II, IV, V, or VII military explosives, shall be separated as follows:

(1) With a permanent steel deck or bulkhead intervening, the separation shall not be less than 10 feet in any direction except where there exist additional intervening permanent steel decks or bulkheads in which case the distance requirement may be reduced by 50 percent.

(2) Without a permanent steel deck or bulkhead intervening, the separation shall not be less than 25 feet in any direction.

(b) Class VIII ammunition, when stowed on board the same vessel with Classes IX, X, or XI military explosives, shall be separated as follows:

(1) With a permanent steel deck or bulkhead intervening, the separation shall not be less than 25 feet in any direction except where there are existing additional intervening permanent steel decks or bulkheads, in which case the distance requirement may be reduced by 50 percent.

(2) Without a permanent steel deck or bulkhead intervening, the separation shall be not less than 40 feet in any direction.

(c) Class VIII ammunition shall not be stowed within 8 feet of the vessel's side, except blasting caps stowed in a portable magazine "On deck" need not meet this requirement.

(d) When Class VIII ammunition is stowed over tween-deck hatch covers, and military explosives are stowed in a hold below, a single layer of commercial 2-inch lumber is required over the tween-deck hatch cover to form the floor of the magazine. Under these conditions, wooden hatch covers may be considered an integral part of the permanent steel deck and the separation requirements of paragraphs (a)(1) and (b)(1) of this section shall apply.

(e) When Class III or VI ammunition is stowed with Class VIII ammunition the provisions governing the stowage and separations of Class VIII shall apply.

(f) When a portable magazine is used for detonator stowage, such magazine may be stowed in the square of a weather deck hatch.

(g) Upon approval by the Captain of the Port, a portable magazine containing Class VIII ammunition may be stowed in an isolated cabin or steel deck house secure from aircraft machine-gun fire and not subject to casual contact by persons on board the vessel.

§ 146.29-95 Ventilation of magazine. A magazine that is not fitted with ventilating ducts to the atmosphere shall be ventilated by omitting the top course of boarding on the sides of the magazine to provide a clear space at least 1 inch and not more than 6 inches below the lower flange or toe of the deck beam within the compartment or hold in which the magazine is constructed. Ventilators of systems feeding directly into a magazine or a hold in which military explosives are stowed shall be covered with a layer of wire screen of not less than ¼-inch mesh at the weather end of the coat. This screen shall be attached securely in place in such a manner as to insure a positive closure.

§ 146.29-97 Statements of characteristic properties and hazards. (a) In § 146.29-100 there are statements in italics setting forth certain characteristics and hazards of the substances or articles listed therein. It is not intended, nor shall it be assumed, that these statements set forth all of the characteristic properties or hazards of the particular

substance or article and such statements as are shown are informative only.

(b) For the purpose of the regulations in this subpart Army Class XII explosives are treated as follows:

(1) Ammonium nitrate is classified as an oxidizing material.

(2) Wet nitrocellulose wet with 20 percent of water is classified as a flammable solid.

(3) Wet nitrocellulose wet with 30 percent of alcohol or flammable solvent is classified as a flammable liquid.

§ 146.29-99 Explosives admixture charts. (a) Chart A of this section indicates the compatibility of the various classes of ammunition described in § 146.29-100. Chart B of this section indicates the compatibility within the class of items of Classes XI–C and XI–D.

(b) A shaded block at an intersection of horizontal and vertical columns in Chart A indicates that the particular class of military explosives shown by the heading of the horizontal column to the left must NOT be stowed in the same hold or compartment with the particular class of military explosives indicated by the heading of the vertical column at the top of the chart. A shaded block at the intersection of horizontal and vertical columns in Chart B indicates that that particular item shown by the heading of the horizontal column to the left must NOT be stowed "On deck" together unless separated by the superstructure, or in the same hold or compartment with the item indicated by the heading of the vertical column at the top of the chart. For specific provisions of stowage, and items included in each class, refer to § 146.29-100.

(c) In the charts the letters refer to the following notes:

Note A: Class II-F may be stowed in the same lower hold or tween-deck hold with Classes II-C, II-E, II-G, and III provided the Class II-F ammunition is bottom stowed and provided further that no other class of explosive or ammunition is stowed in the hold or tank below.

Note B: Class II-F may be stowed in the same deep tank, lower hold or tween-deck hold with Classes II-B, IV, V, VII: *Provided*, That the Class II-F ammunition is bottom stowed: *And provided further*, That no other class of explosives or ammunition is stowed in the hold or tank below.

Note C: Propellant charges Class II-A for separate loading artillery projectile filled with Class XI-A or XI-B chemical may be stowed together in the same hold or compartment: *Provided*, That the propellant charges are "top stowed," the two items being separated by a type "A" dunnage floor. When so stowed the propellant charges shall not be overstowed with any other cargo.

Note D: Class II-J TH incendiary filled ammunition shall be stowed only in a deep tank or lower hold, and in all cases, bottom stowed, except that a limited quantity shipment not in excess of 500 lbs. net TH content may be stowed on deck in a special magazine constructed of material as set forth in § 146.29-81(c) and provided such magazine has an insulation of sand at least 1 foot thick on the bottom. This magazine shall be so mounted that there is at least 1 foot void between its bottom and the deck on which it is mounted, and its preferred location is aft. There shall be one charged fire hose in the immediate vicinity of this magazine when this class ammunition is stowed therein. There shall be only one such stowage per vessel and that stowage shall not be over living quarters or hatches in which military explosives, other dangerous articles, or ship's stores are stowed below.

Note E: Class I, V (unfuzed and no fuzes packed in container), VII (unfuzed and no fuzes packed in container), and IX-B may be stowed with Class X-A if the two classes are separated by a partition bulkhead or type "A" dunnage floor.

Note F: See Chart B for compatibility of items within this class.

Note G: May be stowed together if separate stowage is not available.

Note H: May be stowed together if the two classes are separated by a partition bulkhead on or a type "A" dunnage floor.

Note I: [Reserved]

Note J: Classes III and VI may not be overstowed with any other type of cargo or ammunition except classes III, VI and VIII. Class VIII may not be overstowed with any other type of cargo.

Note K: Class IX–C must be stowed in a separate magazine if stowed in the same hold with Class I.

§146.29-100 Classification, handling and stowage chart.

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
1						
Small arms ammunition w/o explosive bullets, detonating fuzes, DOT Class C; mechanical time fuze and its items.	Small arms ammunition is a variety of fixed ammunition and includes blank ammunition and shotgun shells designed to be fired from a pistol, revolver, rifle, shotgun, or similar weapon held by the hand, or by the hand and shoulder, or machine guns of caliber less than 0.75 in. (19.05mm), or blank remover cartridges for pilot seat ejectors and canopy removing catapults, and consists of a metallic, plastic composition or paper cartridge case, a primer and a propelling charge, with or without bullet, shot, tear gas material, tracer components or incendiary ouchi stors or mixtures, but not including bullets loaded with high explosives. (For small arms ammunition with explosive bullets or projectiles see Class IV) Other items of ammunition or component parts of ammunition having similar hazard characteristics to small arms ammunition are also included in this class. Includes but is not limited to: Cartridges (small arms type, less than 0.75 inch or 19.05mm): Aircraft engine starter. Armor piercing. Armor piercing incendiary. Armor piercing incendiary tracer. Ball. Blank. Carbine. Catapult, aircraft ejection seat. Exactor. High pressure test. Ignition. Impulse charges, DOT Class C. Incendiary. Initiator. Powder actuated tool, shipped separately. Remover, aircraft canopy. Rifle grenade. Slick mortar (MK1). Tear gas. Thruster. Tracer. Catapult w/cartridge: Aircraft ejection seat. Chemical delay pencil. Detonating cord. Detonating fuzes, DOT Class C. Empty cartridge case, primed. Firing device w/o detonator. Fuse, blasting cap. Grenade projection adapter and similar inert devices when packed with blank small arms cartridge. Grenades, empty primed. Igniter, torpedo. Mechanical time fuze. Miniature practice bomb signal. Powder actuated tool w/cartridge packed in the same outside box. Primer, lock combination. Primer, lock electric. Primer, small-arms. Primers, percussion cap (such as used in small-arms ammunition). Remover w/cartridge, aircraft canopy, M1. Shell, shotgun. Small arms ammunition w/o explosive bullets. Time cutter (MK2). Note: The U.S. Army and Navy definitions of small-arms is based on tactical considerations. The Coast Guard definition shall take precedence in all cases involving transportation, handling, and stowage as cargo or board merchant vessels which are subject to the regulations in this part. This Coast Guard class does not require a permit. See §146.29-13 and §146.29-15.	"Cannon primers"	C	The principal hazard in connection with the stowage of this class of ammunition is its involvement in fire from outside source. Under such conditions the presence of this type of ammunition will not contribute excessively to the fire. Fire may be controlled and extinguished by flooding or spraying with large amounts of water. Missiles from burning ammunition will not be projected with any considerable velocity. Fire fighting personnel should take normal precautions and not expose themselves unnecessarily.	Any compartment or hold. May be stowed in any hold above, any hold below, or a hold adjacent to one in which flammable liquids, flammable solids or oxidizing materials, flammable compressed gases, hazardous articles or combustible liquids are stowed. Provisions of §146.29-59 (Stowage adjacent to other dangerous articles) shall be complied with unless specifically exempted by the above paragraph. May be overstowed. May be transported in vans stowed on deck. Small arms ammunition w/o explosive bullets may be stowed adjacent to heat bulkheads without the additional requirements stipulated by §146.29-75(c). When Class II-A, IX-A, IX-B, X-A, or XI-B ammunition is stowed in the same hold or magazine with this class, the two stowages must be separated by a partition bulkhead or type "A" dunnage floor. Class III, VI, and VIII ammunition may not be overstowed with this class. See §146.29-99(c), Note D for stowage with Class II-J.	1. Observe marking on package to be certain that no small arms ammunition with explosive bullets is included. 2. Do not subject packages to rough handling. 3. Maximum weight per draft shall not exceed 3,000 lbs plus 10%. 4. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 5. Lifts of palletized units shall not be bend except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 6. The limiting weights noted above are for a 5-ton boom. See §146.29-41.

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
E A						
Bulk propellants such as: Ballistite, Cordite, FNH, NH, and NC powders; propellant charges, "Made-up bag charges" in outside shipping containers.	Propellant explosives for cannon in bulk. Rocket propellants in bulk. Propellant charges (made up charges) in cloth powder bags with igniter attached and with or without its primer and packed in outside metal or fiber pack containers. Includes but is not limited to: Ballistite (bulk) for any purpose in large grains, sheets, or masses. Cartridge starter, jet engine Charge, propelling for rod, earth blast driven. Cordite FNH powder. NC powder (SPD). NH powder (SPDN). Propellant charges for separate loading ammunition such as 6", 8", 12", 14", 16", 155mm, 240mm, 280mm. SPCA powder. SPCG powder.	"Propellant explosives, solid, Class A." "Propellant explosives, solid, Class B." "Starter cartridge, jet engine."	A B B	Loose powder may be ignited by spark, friction, or intense heat. Powder dust is especially hazardous. Burns rapidly with excessive heat. Burning powder in ships hold may explode, producing structural damage and missiles. If involved in a fire, immediately apply water freely and in quantity.	*AMMUNITION STOWAGE OR PORTABLE MAGAZINE* Shall not be overstowed with any other kind of cargo except bomb fin assemblies, empty water fillable practice bombs and empty auxiliary gas tanks. When Class I ammunition is stowed in the same hold or magazine with this class, the two stowages must be separated by a partition bulkhead or type "A" dunnage floor. Propellant charges of this class, for separate loading artillery projectile, filled with Class 10-A or 10-B chemical may be stowed together in the same hold or compartment provided the propellant charges are "top stowed," the two items being separated by a type "A" dunnage floor. When so stowed, the propellant charges shall not be overstowed with any other cargo. For stowage adjacent to other dangerous articles see §146.29-59. Bulk propellants shall not be loaded at an ammunition loading pier. May be transported in vans stowed on deck.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Packages shall be handled in such a manner as to insure that no spark or friction will occur. 4. Observe packages or containers for evidence of rusting or inability to retain contents and reject any showing such signs. 5. In event a package is damaged and powder is spilled, immediately stop operations and sweep up any loose powder. 6. Remove damaged container and residue of powder to a safe location. 7. Gravity roller conveyor shall not be used unless authorized by the Captain of the Port in ports of facilities under his jurisdiction. At other ports or facilities authority for such use may be granted by the Officer in Charge. 8. Cargo handling stevedore gear may be trays, skidboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 9. Cargo nets w/o trays, skidboards, pallets, or pieplates are not permitted. 10. The maximum permitted weight per draft when handled by pallet, skidboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 11. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 12. Lifts of palletized units shall not be bersd except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 13. The limiting weights noted above are for a 5-ton boom. See §146.29-41.
E B						
Fixed ammunition without explosive projectile and like items.	Fixed ammunition with solid projectile, blind loaded projectile, empty projectile or without projectile—(the explosive components consisting of the primer and powder charges in a cartridge case); cartridge cases primed and containing powder charges; practice grenades; practice and target rockets. Includes but is not limited to: Ammunition for cannon: Blank. Blind loaded and plugged (BL & P). Blind loaded with tracer (BL & T). Empty projectile. Solid projectile. Without projectile. Ammunition, armor piercing, shot (w/o HE). Cartridge, 20 mm HPT, LPT, BLT, TP, BLP. Cartridges, blank, salubing. Cartridges, fixed and semifixed, with smoke projectiles (other than HC). Cartridges, impulse. Cartridges, semi fixed for Navy type guns: 5"/38, 5"/51, 5"/54, 6"/47. Cartridges, semi fixed 120mm (Army w/o projectile). Charges: Catapult (other than aircraft personnel). Jato (DOT Class B). Rocket—target. Rocket Motors (w/o rocket heads). Rocket, packed with but not assembled to inert rocket heads. Rocket, practice, assembled with inert head.	"Ammunition for cannon with empty projectile." "Ammunition for cannon with inert loaded projectile." "Ammunition for cannon with solid projectile." "Ammunition for cannon w/o projectile." "Jet thrust units (JATO) Class B." "Special fireworks."	B B B B B B	The principal hazard associated with this class of ammunition is its involvement in a fire. Pressures which would cause serious structural damage are not usually generated. If involved in a fire, it is possible the fire may be controlled or extinguished by flooding or spraying with large amounts of water. Fire fighting personnel should take appropriate precautions and not expose themselves.	*AMMUNITION STOWAGE OR PORTABLE MAGAZINE* Boxed and crated ammunition may be overstowed with non-dangerous cargo and compatible explosives. Tanked ammunition may be overstowed with bomb fin assemblies, empty water fillable practice bombs and empty auxiliary gas tanks. May be stowed in the same deep tank, lower hold or tweendeck hold with Class II-F ammunition provided the Class II-F is bottom stowed and provided further that no other class of military explosives is stowed in the hold or the tank below. May be stowed in the same deep tank or lower hold with Class II-J ammunition provided the Class II-J is bottom stowed. For stowage adjacent to other dangerous articles see §146.29-59. May be transported in vans stowed on deck. When Class X-C ammunition is stowed in the same hold or magazine with this class, the two stowages must be separated by a partition bulkhead or type "A" dunnage floor. Class III and VI ammunition may not be overstowed with this class of ammunition.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Cargo handling stevedore gear may be trays, skidboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 4. Cargo nets without trays, skidboards, pallets or pieplates are not authorized. 5. The maximum permitted weight per draft when handled by pallet, skidboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 6. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 7. Lifts of palletized units shall not be bersd except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 8. The limiting weights noted above are for a 5-ton boom. See §146.29-41.

For explanation of abbreviations and reference marks, see last page of this tariff.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
II-D Chemical ammunition, WP or PWP filled (solid)	All chemical ammunition, including fixed, semi-fixed and separate loading, filled with WP or PWP (white phosphorus) when assembled or packed with or w/o their ignition elements, bursting charges, fuzes or propellants. WP or PWP shipped in bulk in drums, barrels, or other authorized shipping containers shall be classified as a flammable solid. WP or PWP when shipped in authorized DOT specification containers or Army Materiel Command specification containers of integrity equal to DOT containers (including projectiles, bombs, and rocket heads, w/o ignition elements, bursting charges or fuzes), may be handled and stowed either as a flammable solid or as chemical ammunition Class II-D. Includes but is not limited to: Bombs, aircraft, WP or PWP filled British Calling Cards Fire leaves Grenades, hand, WP or PWP filled Grenades, rifle, WP or PWP filled Igniters, phosphorus filled Projectiles, WP or PWP filled packed w/ or w/o propellants Rockets Heads, WP or PWP filled Rockets, assembled w/ motors, WP or PWP filled The U.S. Army and Navy, when shipping ammunition filled with white phosphorus, mark such ammunition and the containers thereof with the word "smoke" and the symbol WP or PWP. The ammunition is also marked with one yellow band.	"Ammunition for cannon with explosive projectile." "Ammunition for cannon with smoke projectile." "Explosive bomb" "Explosive projectile." "Igniter" "Special fireworks" Shipping name of item when shipped as flammable solid	A A A A C B FS	The principal characteristic of white phosphorus is that of spontaneously igniting upon exposure to air, burning with an intensely hot flame, and giving off large volumes of white smoke. The fumes are highly discomforting. Burning phosphorus gives off phosphorus oxide which is toxic upon sustained exposure thereto. Phosphorus is intensely poisonous when taken internally. It becomes liquid at 111° F. Leakage which sometimes occurs, usually gives warning by smoke. Ammunition filled with fuzes and boosters, if involved in a fire will usually explode with moderate violence thus tending to spread the fire rapidly. Apply water freely and in quantity to control spread of fire. Steam or fog is also effective but less so than water. It is necessary to keep the loose WP or PWP completely covered with water to prevent reignition. Organic material contaminated with WP or PWP such as dunnage in the holds of vessels, must be removed and disposed of by burning. Otherwise after drying out, these substances are likely to reignite. Rockets, WP filled, assembled with motor and involved in a fire will present an additional hazard due to the propulsive nature of the rocket. Loose phosphorus in contact with skin tissue will adhere causing painful burns and continue to consume skin tissue until removed. A solution of copper sulphate is effective in counteracting this action. Use rubber protective gloves, boots, aprons, and gas masks to provide effective protection.	*AMMUNITION STOWAGE, CHEMICAL AMMUNITION STOWAGE, PORTABLE MAGAZINE, OR DEEP TANK STOWAGE* It is important to stow in locations not subject to temperatures above 100° F. When shipments of Army ammunition cannot be so stowed the following shall be complied with. WP or PWP filled items of ammunition shall be stowed in a nose up position unless other requirements are specified by the Army. The position of the nose end of the item of ammunition is marked on the outside package or container. Drums or other authorized DOT or Army Materiel Command specification containers filled with WP or PWP may be stowed in the same hold or compartment with chemical ammunition Class II-D. For stowage adjacent to other dangerous articles see § 146.29-59. When given chemical ammunition stowage, see § 146.29-85 for additional requirements. May be transported in vans stowed on deck.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Observe packages or projectiles for leakage and reject any showing such signs. 5. Packages or containers shall be stowed in the position indicated by their marking. 6. Cargo handling stevedore gear may be trays, skidboards, pallets, or pieplates provided they are used with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 7. Cargo nets w/o trays, skidboards, pallets, or pieplates are not permitted. 8. The maximum permitted weight per draft when handled by pallet, skidboard, tray or pieplate used with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 9. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 10. Lifts of palletized units shall not be lifted except when using a sling so designed as to prevent the upper tiers from shifting or falling from the draft. 11. Wire rope slings are permitted when handling unboxed bombs or containers filled with WP or PWP. (See table Limiting Loads, Class X-A.) 12. Drums of WP or PWP shall not be handled by attaching hooks to the chime of the drums. 13. The limiting weights noted above are for a 5 ton boom. See § 146.29-41.

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
§ C						
Pyrotechics (fireworks)	Fireworks are all manufactured articles designed primarily for the purpose of producing visible or audible pyrotechnic effects by combustion or explosion. Includes but is not limited to: Blue lump Bomb, target identification Cartridge igniter, turbo jet engine Delay electric igniters Depth charge markers, day Destroyer, document, No 3 Firecrackers, except M30 Fire starter Fireworks - bombs Fireworks - projectile Flares of all types, such as Aircraft Airport Bombardment Float High altitude parachute Parachute Parachute trip Tow target Trip Flash cartridge 72 grains or under Flash reducer (non black powder) Flash sheets (Ild packing, DOT) Float lights Fuse igniters Fuse lighters Fusee, warning, railroad Grenade, hand or rifle, colored smoke (other than HC, WP or WPW filled) Igniters, M1 and M2 Illuminating grenades and projectiles Metal powders (Ild packing DOT) Photoflash bomb M122 Photographic flash powder (Ild packing DOT) Pull wire fuse lighter Pyrotechnic mixture, 72 grains or under Quick match Roman candles Salutes Separate loading smoke projectiles (other than HC, WP, WPW filled) when assembled with or without ejection charges and or fuze Signals Aircraft float light Day distress aircraft Distress hand smoke Double star Drift day (bronze powder, inert) Drift night (red phosphorous) Emergency identification, smoke, star submarine Ground cluster Ground high burst ranging Ground parachute smoke Ground parachute star Highway Pistol rocket, Comet shower, smoke star Single star Submarine float Simulator Boobytrap, flash, illuminating, whistling 72 grains or under Hand grenade, M116 Smoke pots w/o oil Squibs of all kinds Tear gas pot fuse Torpedo signalling, railway Tracers Very signal lights	"Common fireworks" "Electric squibs" "Fuse igniters" "Fuse lighters" "Igniter" "Railway fusee" "Railway torpedoes" "Safety squibs" "Special fireworks"	C C C C C C B C B	The principal hazard is involvement in a fire Some pyrotechnics may ignite spontaneously if exposed to moisture or high temperatures, but under these conditions most types tend to become less sensitive and more difficult to ignite Aircraft flares and high burst ranging ground signals involved in a fire may explode Most other types burn with intense heat and without serious explosion If involved in a fire immediately apply water freely and in quantity Steam or fog is also effective but less so than water Fire fighting personnel should work from behind barriers and not expose themselves unnecessarily	*AMMUNITION STOWAGE, DEEP TANK STOWAGE, PORTABLE MAGAZINE OR PYROTECHNIC LOCKER* Shall be stowed away from heat and in a dry location, protected against moisture contacting the stowage Shall not be overstowed with any other kind of cargo May be stowed in the same deep tank, lower hold or between-decks hold with III-F provided the Class II-F ammunition is bottom stowed and provided that no other class of explosives or ammunition is stowed in the hold below such stowage May be stowed in the same deep tank or lower hold as Class II-J provided the II-J ammunition is bottom stowed For stowage adjacent to other dangerous articles see § 146.29-59 May be transported in vans stowed on deck	1. Handle by hand or mechanical means 2. Do not drag, drop, tumble, walk or otherwise subject packages to shock 3. Do not load during excessive rainy weather, unless complete protection against moisture coming in contact with the package is provided 4. Do not use chute in loading or unloading 5. Cargo handling stevedore gear may be trays, skipboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized 6. Cargo nets without trays, skipboards, pallets, or pieplates are not permitted 7. Packages or containers shall be stowed in the position indicated by their marking 8. The maximum permitted weight per draft when handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10% 9. Drafts consisting of one or more palletized units shall not exceed 8,000 lbs. plus 10% 10. Lifts of palletized units shall not be lifted except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 11. The limiting weights noted above are for a 5 ton boom. See § 146.29-41.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
II-E Chemical ammunition, HC filled (solid)	All chemical ammunition including fixed, semi-fixed and separate loading, filled with HC (Hexachloroethane, a smoke mixture) when assembled or packed w/ or w/o their ignition elements, bursting charges, ejection charges, fuzes or propellants. HC mixture shipped in bulk in drums, barrels or other authorized shipping containers shall be classified as an oxidizing material HC mixture when shipped in authorized DOT specification containers or Army Materiel Command specification containers of integrity equal to DOT containers [including projectiles and bombs w/o ignition elements, bursting charges or fuzes] may be handled and stowed either as an oxidizing material or as chemical ammunition Class II E Includes but is not limited to Bombs, aircraft, smoke, HC filled Bombs, floating, smoke, HC filled Bombs, smoke identification, HC filled Float, smoke, HC filled Grenades, hand, HC filled Grenades, signal, HC filled Grenades, colored smoke, HC filled Pots, smoke, HC filled Projectiles, artillery, smoke, HC filled Projectiles, mortar, smoke, HC filled The U.S. Army and Navy, when shipping ammunition filled with HC smoke or colored smoke, mark such ammunition HC smoke or colored smoke and mark the ammunition with one yellow band	"Ammunition for cannon with smoke projectile." "Explosive bomb" "Explosive projectile." "Special fireworks" Shipping name of item when shipped as oxidizing material	A A A B Only M.	HC (hexachlorethane mixture) is subject to spontaneous ignition through the action of moisture on the HC mixture. Once started, the temperature rises quickly and may be sufficient to cause adjacent containers of HC to ignite. The reaction once started is self-supporting and requires no oxygen. Water can be applied freely to prevent spread of fire. The use of Foamite, CO_2 or fog is less effective. Personnel fighting fire involving HC articles of ammunition especially when stowed in the hold of a vessel, should avoid working in dense smoke if not wearing rescue breathing apparatus or gas masks. As there will probably be an oxygen deficiency in dense smoke, self-contained breathing apparatus should always be used in preference to gas masks.	*AMMUNITION STOWAGE, CHEMICAL AMMUNITION STOWAGE, PORTABLE MAGAZINE, OR DEEP TANK STOWAGE* It is important to stow in locations not subject to temperatures above 100° F. and protected from moisture. Stowage shall be accessible from cargo hatch or other access means to the hold or compartment. Drums or other authorized DOT or Army Materiel Command specification containers filled with HC may be stowed in the same hold or compartment with chemical ammunition Class II E. May be stowed in the same deep tank, lower hold or tween-deck hold with Class II-F provided the Class II-F ammunition is bottom stowed and provided further that no other class of military explosives is stowed in the hold or tank below. For stowage adjacent to other dangerous articles see § 146.29-59. When given chemical ammunition stowage, see § 146.29-85 for additional requirements. May be transported in vans stowed on deck. Class III may not be overstowed with this class of ammunition.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Observe packages or projectiles for leakage and reject any showing such signs. 5. Packages or containers shall be stowed in the position indicated by their markings. 6. Cargo handling stevedore gear may be trays, skipboards, pallets or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 7. Cargo nets w/o trays, skipboards, pallets, or pieplates are not permitted. 8. The maximum permitted weight per draft when handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards, shall not exceed 2,400 lbs. plus 10%. 9. Drafts consisting of one or more palletized units shall not exceed 8,000 lbs. plus 10%. 10. Lifts of palletized units shall not be bend except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 11. Wire rope slings are permitted when handling unboxed bombs or containers filled with HC mixture. (See table of Limiting Loads, Class II-A.) 12. Drums of HC mixture shall not be handled by attaching hooks to the chime of the drums. 13. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

II-F						
Chemical ammunition, FS or FM smoke filled (liquid).	All chemical ammunition including fixed, semi-fixed and separate loading filled with smoke, FS (sulfur trioxide in chlorosulfonic acid) or FM (titanium tetrachloride) when assembled or packed with or w/o their bursting charges, fuzes, or propellants. FS or FM shipped in drums, barrels, cylinders or other authorized containers shall be classified as a corrosive liquid. FS or FM when shipped in authorized DOT specification containers or Army Materiel Command specification containers of integrity equal to DOT containers (including rocket heads, w/o bursting charges or fuzes) may be handled and stowed either as corrosive liquid or as a chemical ammunition Class II-E. Includes but is not limited to: Grenades, frangible, smoke FS or FM filled. Grenades, smoke, FS or FM filled. Rockets, FS or FM filled. Projectile, artillery, FS or FM filled. Projectile, mortar, FS or FM filled. Spotting charges, FS filled. The U.S. Army and Navy, when shipping ammunition filled with FS or FM smoke, mark such ammunition and the containers thereof with the word "Smoke" and the symbol FS or FM. The ammunition is also marked with one yellow band.	"Ammunition for cannon with smoke projectile." "Explosive projectile." "Rocket ammunition with smoke projectile." Shipping name of items when shipped as corrosive material.	A A A Cor. L.	FS (sulfur trioxide in chlorosulfonic acid) and FM (titanium tetrachloride) are liquids which fume badly when hot. They react violently with small amounts of water and form a dense white smoke upon release to the atmosphere. FS is highly corrosive both as a liquid and as a smoke. FM is corrosive in liquid only, but its smoke is very irritating. Leakage of FS or FM should be washed off immediately with large volumes of water. Personnel working in a confined space where high concentrations of FS or FM smoke exists should use rubber protective gloves, boots, aprons and gas masks for effective protection.	*AMMUNITION STOWAGE, CHEMICAL AMMUNITION STOWAGE, PORTABLE MAGAZINE, OR DEEP TANK STOWAGE* It is important to stow away from heat and to protect from moisture. May be stowed in the same deep tank, lower hold or tween-deck hold with Classes II-C, II-E, II-G, and III provided the Class II-F ammunition is bottom stowed and provided further that no other class of explosives or ammunition is stowed in the hold or tank below. May be stowed in the same deep tank, lower hold or tween-deck hold with Classes II-B, IV, V, and VII provided the Class II-F ammunition is bottom stowed and provided further that no other class of explosives or ammunition is stowed in the hold or tank below. Drums of other authorized DOT or Army Materiel Command specification containers filled with FS or FM may be stowed in the same hold or compartment with chemical ammunition Class II-E. Shall not be stowed over other types of ammunition. For stowage adjacent to other dangerous articles see § 146-29-59. When given chemical ammunition stowage, see § 146-29-85 for additional requirements. May be transported in vans stowed on deck.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Observe packages or projectiles for leakage and reject any showing such signs. 4. Containers or projectiles shall be stowed in the position indicated by their marking. 5. Cargo handling stevedore gear may be trays, skipboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 6. Cargo nets w/o trays, skipboards, pallets, or pieplates are not permitted. 7. The maximum permitted weight per draft when handled by pallet, skipboard, tray or pieplate filled with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 8. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 9. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 10. Drums of FS or FM shall not be handled by hooks attached to the chime of the drums. 11. The limiting weights noted above are for a 5-ton boom. See § 146-29-41.
II-G						
Chemical ammunition, incendiary composition, IM, PT or NP filled (jet gel).	Chemical ammunition filled with IM, PT or NP (thickened fuels) when assembled or packed with or w/o ignition elements, bursting charges or fuzes. IM, PT or NP shipped in drums, barrels or other authorized shipping containers shall be classified as a flammable solid. IM, PT or NP when shipped in authorized DOT specification containers or Army Materiel Command specification containers of integrity equal to DOT containers (including bombs w/o ignition elements, bursting charges or fuzes) may be handled and stowed either as a flammable solid or as chemical ammunition Class II-G. Napalm B in containers identified as DOD BLU-27/B, BLU-29/B, and BLU-32/B A/B Pam bombs overpacked in outside shipping crate may be shipped as "Flammable Liquid, N.O.S." Includes but is not limited to: Bombs. Bombs, cluster incendiary. Frangible grenades. The U.S. Army and Navy, when shipping ammunition filled with these incendiary compositions, mark such ammunition or containers thereof with the Army Materiel Command symbol of the filler and one purple band.	"Explosive bomb" "Grenade, hand" "Special fireworks" Shipping name of items when shipped as flammable solid.	A A B FS.	The principal hazard of IM, PT or NP filled items is involvement in a fire. They burn rapidly with intense heat. Extinguishment of fires is best accomplished by means of water fog. Fog foam or a foam stream (mechanical or chemical) is likewise effective. CO_2 should not be used unless the fire is small and in its incipient stage. In holds of a vessel large volumes of water are recommended as a cooling agent provided such may be employed without "floating off" burning gel. The vapors from heated napalm are toxic and rescue breathing apparatus should be worn while working in noticeable concentrations. Clusters of incendiary bombs in this category may contain a certain percentage of bombs bearing a high explosive charge capable of causing fragments which could be dangerous to fire fighting personnel. Incendiaries of this type may contain ignition components of WP adding an additional hazard.	*AMMUNITION STOWAGE, CHEMICAL AMMUNITION STOWAGE, PORTABLE MAGAZINE, OR DEEP TANK STOWAGE* Shall not be stowed within 10 feet of a heat bulkhead. May be stowed in the same deep tank, lower hold or tween deck hold with Class II-F provided the Class II-F ammunition is bottom stowed and provided further that no other class of explosives or ammunition is stowed in the hold or tank below. May be stowed in a deep tank or lower hold with Class II-J incendiary ammunition provided the Class II-J is bottom stowed. For stowage adjacent to other dangerous articles, see § 146-29-59. When given chemical ammunition stowage, see § 146-29-85 for additional requirements. May be transported in vans stowed on deck.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages, containers or bombs to shock. 3. Do not use chute in loading or unloading. 4. Observe packages, containers or bombs for failure or inability to retain contents and reject any showing such signs. 5. Packages or containers shall be stowed in the position indicated by their marking. 6. Cargo handling stevedore gear may be trays, skipboards, pallets, or pieplates provided they are fitted with nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 7. Cargo nets w/o trays, skipboards, pallets or pieplates are not permitted. 8. The maximum permitted weight per draft when handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 9. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 10. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 11. Wire rope slings are permitted when handling unboxed bombs or containers filled with IM, PT or NP. (See table of Limiting Loads, Class X-A.) 12. Drums of IM, PT or NP shall not be handled by attaching hooks to the chime of the drums. 13. The limiting weights noted above are for a 5-ton boom. See § 146-29-41.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
II-H						
Chemical ammunition, Water activated	Chemical ammunition filled with sodium, calcium carbide, calcium phosphide, lithium hydride, with or w/o explosive components. Includes but is not limited to: Beacons, NEA Can, false target Depth charge markers, night Grenades, sodium filled Ignitant, sodium filled Pots, torpedo torch Projectile, false target	There are no provisions in the current DOT regulations for the marking of this class of ammunition.	.....	On contact with moisture, metallic sodium or lithium hydride will liberate large quantities of hydrogen gas thus producing an explosive hazard. The reaction of metallic sodium with water is sufficiently violent to cause ignition of the liberated hydrogen. Fumes from burning sodium are caustic. On contact with moisture, calcium carbide or calcium phosphide will liberate phosphine and acetylene gases. The phosphine is toxic but extremely unstable, ignites spontaneously and at the same time ignites the acetylene gas. Fires involving these items cannot be extinguished by water, carbon dioxide or foam. Smothering with an inert substance such as dry sand or dry soda ash offers effective control. Jettisoning should not be accomplished in a port or roadstead as the floats will continue to burn until lifer is consumed jeopardizing other vessels and piers.	*SPECIAL STOWAGE* On deck in a portable magazine, in a deck house or other location readily accessible for jettisoning. Stowage shall be waterproof. Shall not be stowed with any other class of military explosives or any other dangerous articles. May be transported in vans stowed on deck.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Do not load during excessive rainy weather unless complete protection against moisture coming in contact with the package is provided. 5. Observe packages or containers for evidence of failing or inability to retain contents and reject any showing such signs. 6. In event a package is damaged and powder is spilled, immediately stop operations and sweep up any loose powder. 7. Remove damaged container and residue of powder to a safe location. 8. Cargo handling stevedore gear may be trays, skipboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 9. Cargo nets w/o trays, skipboards, pallets or pieplates are not permitted. 10. The maximum permitted weight per draft when handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs plus 10%. 11. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 12 Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 13. The limiting weights noted above are for a 5 ton boom. See §146.29-41.
II-J						
Chemical ammunition, TH incendiary composition filled (solid)	All chemical ammunition filled with incendiary composition TH (thermite, thermate or thermate magnesium) with or w/o fuze or explosive element. Includes but is not limited to: Bombs, incendiary cluster Grenades, thermate Incendiary safe destroyers Thermite burning charges Thermite charges under water Thermite igniters Thermite units 10 lbs The U.S. Army and Navy, when shipping ammunition filled with these incendiary compositions, mark such ammunition or containers thereof with the Army Materiel Command symbol of the filler and with one purple band.	"Explosive bomb" "Grenade, hand" "Igniter" "Special fireworks"	A A C B	The principal hazard of TH filled items is in element in a fire. They burn rapidly with intense heat and usually form large quantities of molten iron. The presence of a small explosive charge in some TH items forms an additional hazard in case of a fire. Carbon dioxide and carbon tetrachloride extinguishers should not be used to combat fires involving TH because the reaction of carbon tetrachloride with molten metal produces toxic gases and that of carbon dioxide on magnesium may produce an explosion. In the hold of a vessel large volumes of water are recommended as an extinguishing agent. Fire fighters should work from behind barriers when possible.	*DEEP TANK STOWAGE, AMMUNITION STOWAGE OR PORTABLE MAGAZINE* May be stowed only in deep tank or lower hold, only with Classes I, II-B, II-C, II-G, and IV and in all cases must be bottom stowed. For limited quantity shipment not in excess of 500 lbs net TH content, see § 146.29-99(b), Note D. For stowage adjacent to other dangerous articles see section §146.29-59.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Observe packages or containers for evidence of failure or inability to retain contents and reject any showing such signs. 5. Cargo handling stevedore gear may be trays, skipboards, pallets or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 6. Cargo nets w/o trays, skipboards, pallets or pieplates are not permitted. 7. The maximum permitted weight per draft when handled by pallet, skipboard, tray or pieplate, fitted with cargo net or sideboards shall not exceed 4,000 lbs. plus 10%. 8. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 9 Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 10 Wire rope slings are permitted when handling unboxed bombs or containers filled with TH. (See table of Limiting Loads, Class X-A) 11. The limiting weights noted above are for a 5-ton boom. See §146.29-41.

III						
Fuzes, PD w/o boosters, fuzes, AT mine, non-chemical, w/o booster, fuzes, bomb tail, w/o boosters, fuzes, tracer, primer detonators, primers, etc.	Point fuzes w/o boosters for projectiles and rockets, and tank mine fuzes (non-chemical) w/o booster, bomb tail fuzes w/o boosters, primer detonators, cannon primers, other than ball primers, when packed in separate shipping containers. Many DOT Class C fuzes, with or w/o boosters, are also of this class. If these fuzes are shipped with boosters, they must be so made and packed that they will not cause functioning of other fuzes, explosives or explosives devices if one of the fuzes detonates in a shipping container. Includes but is not limited to Case combination primer. Case electric primer. Case percussion ignition primer. Case percussion primer. Combination electric and percussion primer. Fuze, anti-tank, mine (non-chemical) w/o booster. Fuze, base percussion. Fuze, bomb tail, w/o booster. Fuze, PD w/o booster. Fuze, percussion. Fuze, M150 w/o booster. Fuze, tracer. Fuze, TSQ w/o booster. Grenade, hand, practice. Igniter, Jato, such as M151. Igniter for rockets, i.e. M12, M18, M20. Magazine, extension primers. Mines practice with spotting charge and or fuze. Percussion primers other than ball. Primer, detonators, fuze, bomb, various delays.	"Cannon primers" "Combination fuzes." "Combination primers." "Igniter, jet thrust" "Percussion caps" "Percussion fuzes" "Time fuzes" "Tracer fuzes"	C C C B C C C C	The amount of explosives in single items of this class varies from 30 to 500 grains. It is likely they will explode progressively. Structural damage caused by the pressures generated would probably be limited to the immediate vicinity. Missiles are light and usually fall within 300 feet. These types of ammunition are loaded with explosives that are sensitive to shock and friction. Shock and fire are the principal hazards to this type of ammunition. If involved in a fire, fire fighting personnel should take normal precautions and not expose themselves unnecessarily. Fire may be controlled and extinguished by flooding or spraying with large amounts of water.	*AMMUNITION STOWAGE SPECIAL STOWAGE, OR PORTABLE MAGAZINE* This class of ammunition shall not be overstowed with any other cargo or ammunition except Classes VI and VIII. May be stowed in the same lower hold or tween-deck hold with Class II F provided the Class II-F is bottom stowed and provided further that no other class of military explosives is stowed in the hold below or the deep tank directly below. For stowage adjacent to other dangerous articles see § 146.29-58.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Gravity roller conveyors not authorized. 4. Do not use chute in loading or unloading. 5. Trays with sideboards shall be used when loading by mechanical means. 6. Packages shall not be stacked on a tray to a height above its sideboards. 7. Trays shall not be swung unnecessarily over open hatches or holds containing military explosives or other dangerous cargo. 8. Trays shall be hoisted and lowered carefully and deposited without undue shock on a mattress or other shock absorbing material. 9. Packages shall be stowed in the position indicated by their markings. 10. The maximum permitted weight per draft when handled by tray with sideboards shall not exceed 2,400 lbs. plus 10%. 11. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 12. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent the upper tiers from shifting or falling from the draft. 13. A portable magazine in which this class of ammunition is stowed and hoisted on board a vessel as a unit load shall not exceed 4,000 lbs. plus 10%. 14. The limiting weights noted above are for a 5 ton boom. See § 146.29-41.
IV						
Fixed and semi-fixed ammunition with explosive loaded projectile	Fixed and semi-fixed ammunition, packed as complete rounds (including artillery, mortar and gun ammunition) grenades and rockets, when assembled with explosive projectiles or bursting charge. Small arms ammunition with explosive bullets or projectiles. Includes but is not limited to Anti-personnel mine, M2 and M3. Artillery ammunition of calibers 0.75" to 5" inclusive, with explosive, illuminating or incendiary projectiles. Grenades, hand, defensive. Grenades, hand, defensive, TNT filled, fuzed or unfuzed. Grenades, hand, fragmentation. Grenades, rifle, AT. Grenades, rifle, HE filled. Gun ammunition of calibers 0.75" to 5" inclusive, with explosive, illuminating or incendiary projectiles. Mortar ammunition (explosive or illuminating). Rockets, with explosive heads packed in the same container with, but not assembled to motors. Rockets, 2.75" FFAR, assembled or unassembled. Rockets, 3.5" HEAT. Small arms ammunition with explosive bullets.	"Ammunition for cannon with explosive projectile." "Ammunition for cannon with incendiary projectile." "Ammunition for small arms with explosive bullets." "Ammunition for small arms with explosive projectile." "Hand grenades" "Rifle grenades" "Rocket ammunition with explosive projectile." "Rocket ammunition with illuminating projectile."	A A A A A A A	A-Sides in this class present a severe fire hazard and usually explode progressively, only a few boxes at a time, many explosions of individual rounds being of a very low order. Pressure which would cause serious structural damage is not usually generated. Most missiles would fall within 600 feet. If involved in a fire it is possible the fire may be controlled or extinguished by flooding or spraying with large amounts of water. Fire fighting personnel should take appropriate precautions and not expose themselves unnecessarily.	*AMMUNITION STOWAGE OR PORTABLE MAGAZINE* Boxed and crated ammunition may be overstowed with non-dangerous cargo and compatible explosives. Palletized ammunition may be overstowed with bomb fin assemblies, empty water fillable practice bombs and empty auxiliary gas tanks. May be stowed in the same deep tank, lower hold or tween-deck hold with Class II-F ammunition provided the Class II-F is bottom stowed and provided further that no other class of military explosives is stowed in the hold or tank below. May be stowed in the same deep tank or lower hold with Class III-J ammunition provided the Class III-J is bottom stowed. For stowage adjacent to other dangerous articles see § 146.29-58. When Class X-G ammunition is stowed in the same hold with this class, the two stowages must be separated by a partition bulkhead or type "A" dunnage floor. Class III and VI may not be overstowed with this class of ammunition.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Cargo handling stevedore gear may be trays, skipboards, pallets or pieplates, provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 4. Cargo nets without trays, skipboards, pallets or pieplates are not authorized. 5. The maximum permitted weight per draft when handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 6. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 7. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 8. The limiting weights noted above are for a 5 ton boom. See § 146.29-41.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
V Separate loading projectiles filled with explosive "D".	Separate loading projectiles of all calibers filled with explosive "D", fuzed or unfuzed, and projectiles filled with explosives "D", fuzed or unfuzed, not assembled to or packed with cartridge cases. Explosive "D" is used as a bursting charge for all projectiles which must withstand severe stresses and shocks before detonating, such as armor piercing projectiles. Includes but is not limited to: Armor piercing projectiles. Deck piercing projectiles. Note: In general, Classes V and VII types of projectiles will be shipped in accordance with the following basic rules: Point fuzed projectiles with false ogives will be crated. Point fuzed projectiles without false ogives will have grommets and eyebolt lifting plugs. Base fuzed projectiles with relatively fragile parts such as false ogives, steel caps and windshields will be crated. Base fuzed projectiles without false ogives will not be crated but will have grommets. All Navy 6" through 16" separate loading projectiles are explosive "D" loaded.	"Explosive projectile".	A	If involved in a fire will very likely detonate as a result of exposure to heat. These projectiles usually explode one at a time and in practically all cases with low order explosion. There is no certainty that en masse explosion will not occur. Most missiles will fall within 1,200 feet.	*AMMUNITION STOWAGE OR PORTABLE MAGAZINE* This ammunition, boxed, unboxed, or palletized units thereof, may be overstowed. Care must be taken not to damage rotating bands of projectiles that are not in containers. May be stowed in the same deep tank, lower hold or tween deck hold with Class II F ammunition provided the Class II F is bottom stowed and provided further that no other class of military explosives is stowed in the hold below or in the tank below. Class V when unfuzed and no fuzes packed in container may be stowed with Class II-A. For stowage adjacent to other dangerous articles see section 146.29-59. Classes III and VI may not be overstowed with this type of ammunition.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Bare projectiles shall not be rolled except under hand control and on a level surface without appreciable incline. 5. Protect rotating bands from damage. Avoid injury to or removal of paint or grease from bourrelet. 6. When handling items packed in outside containers, cargo handling stevedore gear may be trays, skip boards, pallets, or pieplates, provided they are fitted with cargo nets or sideboards. Boxes or trays with removable sides are authorized. 7. Projectile tongs or lifting stud and eye are authorized. Wire slings of a design approved by the Captain of the Port may be used. 8. Cargo nets without trays, skipboards, pallets or pieplates are not permitted. 9. The maximum permitted weight per draft when handled by tray, skipboard, pallet or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 10. Single projectiles weighing in excess of 2,201 lbs. must be loaded or unloaded one at a time. 11. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 12. Lifts of palletized units shall not be hoisted except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 13. The limiting weights noted above are for a 5 ton boom. See §146.29-41.
VI 80 fuzes. Bomb fuzes with boosters. PD fuzes with boosters. Rocket fuzes with boosters.	Base detonating fuzes (for all calibers) and PD fuzes with boosters, bomb and rocket fuzes with boosters, auxiliary booster assembled to or packed with the fuze, depth charge pistol with detonator and with or without booster assembled to or packed with pistol. (For boosters, auxiliary boosters, bursters, etc., having no initiating or priming elements and packed independently, see Class X-A.) Includes but is not limited to: Adapter booster, with detonator. Auxiliary booster, with detonator. Boosters. Burster, with detonator. Depth charge pistol, with detonator and with or without booster. Detonating fuzes, Class A. Fuze: Auxiliary detonating. Base detonating (for all calibers). Bomb nose. Bomb tail with booster. Hydrostatic bomb. Hydrostatic bomb tail. Point detonating with booster. Rocket. Fuzes with boosters assembled thereto. Mine, anti-personnel, non-metallic, M14. Mine firing mechanism, C-1.	"Detonating fuzes, Class A".	A	The amount of explosives in single items does not usually exceed one half pound. It is likely they would explode progressively. Structural damage caused by the pressure generated would probably be limited to the immediate vicinity. Missiles are light and usually fall within 600 feet. These types of ammunition are loaded with explosives that are sensitive to shock and heat. If involved in a fire, it is possible the fire may be controlled or extinguished by flooding or spraying with large amounts of water. Fire fighting personnel shall take appropriate precautions and not expose themselves unnecessarily.	*AMMUNITION STOWAGE, SPECIAL STOWAGE, OR PORTABLE MAGAZINE* This class of ammunition shall not be overstowed with any other cargo or military explosives except Classes III and VIII. For stowage adjacent to other dangerous articles see § 146.29-59.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Gravity roller conveyors not authorized. 4. Do not use chute in loading or unloading. 5. Trays with sideboards shall be used when loading by mechanical means. 6. Packages shall not be stacked on a tray to a height above its sideboards. 7. Trays shall not be swung unnecessarily over open hatches or holds containing military explosives or other dangerous cargo. 8. Trays shall be hoisted and lowered carefully and deposited without undue shock on a mattress or other shock-absorbing material. 9. Packages shall be stowed in the position indicated by their markings. 10. The maximum permitted weight per draft when handled by tray with sideboards shall not exceed 2,400 lbs. plus 10%. 11. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 12. Lifts of palletized units shall not be hoisted except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 13. A portable magazine in which this class of ammunition is stowed and hoisted on board a vessel as a unit load shall not exceed 4,000 lbs. plus 10%. 14. The limiting weights noted above are for a 5 ton boom. See §146.29-41.

VI						
Separate loading HE projectiles, mass detonating, with other than explosive "D".	Separate loading projectiles of all calibers, fuzed or unfuzed, except those loaded with explosive "D"; and loaded projectiles except those loaded with explosive "D", fuzed or unfuzed, not assembled to or packed with cartridge cases, fuzed cluster fragmentation bombs, rocket heads fuzed or unfuzed and less than 200 lbs. gross weight, antitank mines, packed with fuzes in same container or box. Includes but is not limited to: Anti tank mines, packed with fuzes in same container or box. Cluster, fragmentation bomb (with individual bombs fuzed but without cluster fuzed). High explosive anti tank projectile. High explosive projectile. Rocket heads fuzed or unfuzed and under 200 lbs. not assembled to or shipped with rocket motors. Wafers of fragmentation bombs (with individual bombs fuzed). In general, Classes V and VII types of projectiles will be shipped in accordance with the following basic rules. Point fuzed projectile with false ogives will be crated. Point fuzed projectile without false ogives will have grommets and eyebolt lifting plugs. Base fuzed projectile with relatively fragile parts such as false ogives, steel caps, and windshields will be crated. Base fuzed projectiles without false ogives will not be crated but will have grommets to protect rotating bands.	"Explosive bomb" "Explosive mine" "Explosive projectile".	A A A	The principal hazard in transportation will be involvement in fire from sources other than the ammunition itself. Projectiles or bombs in this class may explode progressively but very likely en masse. Most missiles will fall within 1,800 feet and detonation will result in severe structural damage increasing in severity and range in relation to the amount of high explosives involved.	*AMMUNITION STOWAGE OR PORTABLE MAGAZINE* This ammunition boxed, unboxed, or palletized units thereof, may be overstowed. Care must be taken not to damage rotating bands of unboxed projectiles. This class of ammunition when unfuzed and no fuzes packed in container may be stowed with Class X-A. For stowage adjacent to other dangerous articles see § 146.29-59. May be stowed in the same deep tank, lower hold or 'tween deck hold with Class 8-F ammunition provided the Class 8-F is bottom stowed and provided further that no other class of military explosives is stowed in the hold or tank below. When Class X-C ammunition is stowed in the same hold or magazine with this class, the two stowages must be separated by a partition bulkhead or type "A" dunnage floor.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Bare projectiles shall not be rolled except under hand control and on a level surface without appreciable incline. 5. Protect rotating bands from damage. Avoid injury to or removal of paint or grease from bourrelet. 6. When handling items packed in outside containers, cargo handling stevedore gear may be trays, slipboards, pallets or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with removable sides are authorized. 7. Projectile tongs or lifting stud and eye are authorized. Wire slings of a design approved by the Captain of the Port may be used. 8. Cargo nets without trays, slipboards, pallets, or pieplates are not permitted. 9. The maximum permitted weight per draft when handled by tray slipboard, pallet or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 10. Single projectiles weighing in excess of 2,201 lbs. must be loaded or unloaded one at a time. 11. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10 %. 12. Lifts of palletized units shall not be hoisted except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 13. The limiting weights noted above are for a 5- ton boom. See § 146.29- 41.
VII						
All mine fuzes (chemical), etc. Blasting caps. Detonators.	Blasting caps of all types; detonators; grenade fuzes, detonating type, fuzes, anti tank mine (chemical). Includes but is not limited to: Blasting caps. Blasting caps with safety fuze. Destructor, explosive, M10 and M2 Mod 0. Detonating grenade fuzes. Detonators, all types. Detonators, torpedo. Electric blasting caps. Fuzes, All mine (chemical). Percussion elements (Army). Primers, electric. Priming assembly for demolition outfit MK104.	"Blasting caps" "Blasting caps with safety fuze" "Boosters (explosive)". "Detonating fuzes, Class A". "Electric blasting caps". "Percussion caps" "Percussion fuzes" "Time fuzes" "Class A (more than 1000), Class C (1000 or less).	C C A A C C C C	The two primary hazards in the transportation of these devices are shock and involvement in fire. A collateral hazard is the effect of the detonating of these articles upon other explosives or ammunition stowed in proximity to such articles. All of this class ammunition in a unit stowage may explode at one time, but as the total amount of explosives involved is limited structural damage would not tend to be great.	Light missiles having limited range would be forbid. *MAGAZINE STOWAGE "A" SPECIAL STOWAGE, OR PORTABLE MAGAZINE.* The location of magazines is restricted to a hold or compartment in which no other explosives or ammunition (except Classes 8, 8L and VI) are stowed. Shall not be stowed within 8 feet of the vessel's side except blasting caps stowed in a portable magazine. "On deck" need not meet this requirement. This class of ammunition shall not be overstowed with any other cargo. For detail of stowage see § 146.29-93. For stowage with other dangerous articles see § 146.29-59.	Ammunition of Class VIII constitutes a distinct class of ammunition when not assembled in projectiles, bombs, or other ammunition. These types of ammunition are loaded with explosives that are sensitive to shock. The handling and stowage provisions of these regulations give consideration to the probable effect accidental detonation of these devices may have upon other ammunition or explosives stowed within the vessel. 1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Gravity roller conveyors are not authorized. 4. Do not use chute in loading or unloading. 5. Trays with sideboards shall be used when loading by mechanical means. 6. Packages shall not be stacked on a tray to a height above its sideboards. 7. Trays shall not be strung unnecessarily over open hatches or holds containing military explosives or other dangerous articles. 8. Trays shall be hoisted and lowered carefully and deposited without undue shock on a mattress or other shock absorbing material. 9. Packages shall be stowed in the position indicated by their markings. 10. The maximum permitted weight per draft when handled by tray with sideboards shall not exceed 1,000 lbs. plus 10%. 11. Drafts consisting of one or more palletized units shall not exceed 2,400 lbs. plus 10%. 12. Lifts of palletized units shall not be hoisted except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 13. A portable magazine in which this class of ammunition is stowed and hoisted on board a vessel as a unit load shall not exceed 2,400 lbs. plus 10%. 14. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
IX-A						
Explosives in bulk such as: Black powder. Propellant explosives for small arms, etc.	Black powder in bulk, ballistite for small arms, propellant explosives for small arms, black blasting powder, flash powder and powder having similar hazard characteristics to those named. Includes but is not limited to: Ballistite for small arms. Black blasting powder. Black lance powder. Black pellet powder. Black powder. Black powder and magnesium mixtures. Black powder, unglazed. Black rifle powder. Black shell powder. Bull's eye powder #2. Cannon powder. Charges, rifle gun. Charges, spotting, black powder, M1A1, M3, M4. EC blank rifle powder. FF black powder. Firecracker, M80. FFFG black powder. Flash cartridges over 72 grains. Flash powder sheets inner unit over 2 ounces. Flash reducer (black powder with potassium sulfate). Flash sheets in bulk. Flashlight powder in bulk. High rel #65. Igniter pads. Igniter, rocket motor, Class A. IMR #1195. IMR #4166. IMR #4676. Low blasting explosives. Pistol powder #5. Propellant explosives (for small arms). Pyrotechnic mixture, in excess of 72 grains. Rifle powder. Simulator: Booby-trap, flash, illuminating, whistling in excess of 72 grains. Booby-trap, whistling, M114. Gunflash, M110. Projectile, air burst. Projectile, ground burst M115. Smoke pull charge. Sodium nitrate black powder. Spherehexagonal black powder. Sporting powder. Sulfurless black powder.	"Black powder" "High explosives" "Low explosives" "Propellant explosives, solid, Class A." "Propellant explosives, solid, Class B."	A A A A B	Group IX-A explosives constitute a group having relatively similar hazard characteristics which principally consists of being very susceptible to ignition by spark or friction. They burn with explosive violence and under even slight confinement are likely to explode en masse. They are adversely affected by high temperature. Powder dust is especially hazardous.	MAGAZINE STOWAGE "A" OR *PORTABLE MAGAZINE STOWAGE.* When Class I ammunition is stowed in the same hold or magazine with this Class the two stowages must be separated by a partition bulkhead or type "A" dunnage floor. Shall not be overstowed with any other kind of cargo. For stowage with other dangerous articles see §146.29-58.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Packages shall be handled in such a manner as to insure that no spark or friction will occur. 4. Observe packages or containers for evidence of shifting or inability to retain contents and reject any showing such signs. 5. In event a package is damaged and powder is spilled, immediately stop operations and sweep up any loose powder. 6. Remove damaged container and residue or powder to a safe location. 7. Gravity roller conveyor not authorized. 8. Drums and kegs shall be stowed on end with bungs up. Metal cans shall be stowed with filling openings up. Packages or containers shall be stowed in the position indicated by their markings. 9. Cargo handling stevedore gear may be trays, slipboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 10. Cargo nets without trays, slipboards, pallets, or pieplates are not permitted. 11. The maximum permitted weight per draft when handled by tray, slipboard, pallet, or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 12. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 13. Lifts of palletized units shall not be hoisted except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft. 14. The limiting weights noted above are for a 5 ton boom. See §145.29-41.
IX-B						
High explosives such as: Demolition blocks, etc. Dynamite. TNT	High explosives in bulk, items of high explosives such as shaped charges for demolition or other purposes, and powder in bulk, possessing the characteristics of being likely to detonate en masse. Includes but is not limited to: Amatex. Amatol. Ammonite. Ammonium perchlorate particle size, 15 microns and less. Ammonium picrate. Ammonol. Anchor charges. Aqueous slurries. A.S.A. pellets. Atlas amodyn. Balls of cellulose nitrate. Baranol. Beehive charges. Blasting gelatin. British beehive. C.E. pellet. Charge, demolition, block. Charge, demolition, chain.	"High explosives"	A	High explosives in bulk, and demolition blocks have relatively similar hazard characteristics. They may be considered stable in stowage. Can be ignited by spark or friction and detonated by shock. When ignited will burn vigorously. Bulk shipments in amounts likely to be found on board vessels would, if ignited, be very likely to detonate.	*AMMUNITION STOWAGE OR PORTABLE MAGAZINE* Shall not be stowed in the same hold or compartment with other compatible ammunition, or explosives, unless the two are separated by a partition bulkhead or a type "A" dunnage floor. Shall not be overstowed with any other kind of cargo. For stowage adjacent to other dangerous articles see §145.29-59. Military dynamite when transported on a commercial vessel simultaneously with commercial dynamite, and no other military explosives are on board, shall be shipped under those requirements set forth for the shipment of commercial dynamite.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble or walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Packages shall be handled in such a manner as to insure that no spark or friction will occur. 5. Observe packages or containers for evidence of shifting or inability to retain contents and reject any showing such signs. 6. In event a package is damaged and powder is spilled, immediately stop operations and sweep up loose powder. 7. Remove damaged containers and residue of powder to a safe location. 8. Gravity roller conveyors not authorized. 9. Packages or containers shall be stowed in the position indicated by their markings. 10. Cargo handling stevedore gear may be trays, slipboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized.

11. Cargo nets without trays, skipboards, pallets, or pieplates are not permitted.
12. The maximum permitted weight per draft when handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%.
13. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%.
14. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent the upper tier or tiers from shifting or falling from the draft.
15. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
(1-C						
Initiating and priming explosives in bulk.	Initiating and priming explosives when shipped in bulk. Includes but is not limited to: Guanodinitrophenol (DONP, DNOL). Guanyl-nitrosamino-guanildene hydrazine. Guanyl-nitrosamino-guanyl tetrazene. Lead azide. Lead styphnate. Lead trinitrorcorcinate. Mercury fulminate. Nitro mannite. Nitrosoguanidine. Pentaerythrite tetranitrate. PETN. Tetrazene. Note: Bulk priming or initiating explosives in dry condition are not permitted to be transported on board vessels.	"Initiating explosive"	A	Bulk initiating and priming explosives constitute a distinct class of explosives. They are extremely sensitive to shock. The only permitted packing for transportation in bulk consists of a soft proof cotton duck, rubber or rubberized cloth bag in a metal barrel or drum or wooden barrel or keg and wet with 20 to 40% of water or water alcohol mixture. Mercury fulminate and lead azide also have 3" of sawdust saturated with water between the bag and the outer container.	*MAGAZINE STOWAGE "A", SPECIAL STOWAGE OR PORTABLE MAGAZINE STOWAGE* Shall not be stowed in the same magazine with other ammunition or explosives. When storing containers of explosives of this class in a magazine, have each tier floored off with a type "A" dunnage floor. The location of a magazine is restricted to a hold or compartment in which no other military ammunition (except Class 1) is stowed. Shall not be stowed within 8 feet of vessel's side. This class of ammunition shall not be overstowed with any other cargo. For stowage adjacent to other dangerous articles see § 146.29-59.	1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Do not roll barrels on their bases. 5. Gravity roller conveyer not authorized. 6. Barrels or drums contain 20 to 40% water or water alcohol mixture. 7. Observe barrels, drums or containers for evidence of leakage or inability to retain contents and reject any showing such signs. 8. In event a container is damaged immediately stop operations and carefully remove damaged container to a safe location. 9. Drums and kegs shall be stowed on end with bungs up. Containers shall be stowed in the position indicated by their markings. 10. Trays with sideboards shall be used when handling by mechanical means. 11. Containers shall not be stacked on a tray to a height above its sideboards. 12. The maximum permitted weight per draft when handled by tray fitted with sideboards shall not exceed 1,000 lbs. plus tare. 13. Trays shall be hoisted and lowered carefully and deposited without undue shock on a mattress or other shock absorbing material. 14. The limiting weights noted above are for a 5-ton boom. See §146.29-41.

X-A Explosive bombs, mines, torpedoes, etc.	Bombs, bomb clusters, mines, depth charges, warheads (all unfuzed), rocket heads (fuzed or unfuzed and without motors 200 lbs. or more gross weight), torpedo bangalore (unfuzed), and other unfuzed ammunition filled with relatively large amounts of HE; all possessing a similar hazard characteristic of an massе detonation. Includes but is not limited to: Activator – without detonator. Bombs: Armor piercing. Demolition. Depth. Depth charge. Fragmentation. G.P. Photoflash. S.A.P. Shallow water depth. Boosters – without detonators. Boosters, adapter – without detonators. Burster – without detonator. Mines: Aerial. Aircraft. Anti-personnel (unfuzed). Anti-personnel fragmentation (unfuzed). Anti-tank (unfuzed). Anti-tank non-metallic (unfuzed). Grenade. High explosive. Land. Rocket heads (fuzed or unfuzed and without motors 200 lbs. or more gross weight). Signal, underwater sound, w/o fuze. Torpedo bangalore. Torpedo warheads.	"Booster (explosive)." "Burster (explosive." "Explosive bombs." "Explosive mines." "Explosive projectiles." "Explosive torpedoes."	A A A A A A	Fire and shock are the primary hazards to this class of ammunition. They are particularly dangerous because of their tendency to detonate en massе if involved in a fire or subjected to shock. Detonation will result in severe structural damage, increasing in severity and range in relation to the amount of high explosives involved. All high explosive loaded items in this class having thin container walls are relatively easily ruptured or dented. Denting of the container walls by impacts, though not sufficiently severe to rupture them, has occasionally resulted in partial or complete detonation, and such kind of ammunition is said to possess "container dent sensitivity." A certain degree of confinement combined with local heating of the contained explosive by a particular kind of impact apparently causes instantaneous explosive action. But whatever may be the actual mechanics of this phenomenon, the kinds of impacts known to have caused explosion of these items include such impacts as dropping on or striking against a rounded corner, similar to a hatch coaming, impact of one bomb against another, or being struck by handling and transportation equipment. In placing or removing dunnage, an accidental or misdirected blow from a sledge hammer, pinch bar or other hand tool may cause such explosions. The impact need not be violent. A short drop of only 2 feet caused a low order detonation of a depth bomb. Warheads, depth bombs, depth charges, Naval mines, and other like items are in the "Container-dent sensitivity" category. All of the foregoing also apply in substantial effect to containers of this class of ammunition that are not thin walled.	AMMUNITION STOWAGE OR PORTABLE MAGAZINE Items in this class having thin container walls and said to possess "container dent sensitivity" shall not be tiered one layer on top of another unless they are boxed, crated or dunnaged in such a manner that they are properly protected to withstand the superimposed weight. Items having thin walls and possessing "container dent sensitivity" may be overstowed only with very light cargo such as bomb fin assemblies, empty water fillable practice bombs and empty auxiliary gas tanks. Items of this class having thick walled containers may be tiered one layer on top of another provided they are so stowed, dunnaged, blocked and or braced as to prevent movement that is likely to damage the ammunition, the vessel or other cargo. Shall not be overstowed with inert permitted cargo having lesser bearing surface or greater unit weight than any item stowed below. Classes 1, V (unfuzed and no fuzes packed in container), VII (unfuzed and no fuzes packed in container), and DI-B may be stowed with this class. Provided that the two classes are separated by a partition bulkhead or type "A" dunnage floor. Except for wooden barrels or boxes and fiberboard containers, no flammable or combustible material as cargo shall be stowed in a hold or compartment in which this class of ammunition is stowed. When photoflash bombs are stowed with any other military explosive, including items of this class, the two stowages must be separated by a partition bulkhead or a type "A" dunnage floor. For stowage adjacent to other dangerous articles see § 146.29-59.	1. Handle by hand or mechanical means. 2. Do not drop, drag, slide, tumble, walk or otherwise subject these articles to shock. 3. Do not use chute in loading or unloading. 4. Cargo nets shall not be used except to enclose a pallet, skidboard, or tray or as a preventer or save all. 5. Bombs, not crated or boxed, without external fittings or with external fittings protected by lug guards, may be rolled only under continuous hand control on level surfaces or on non-powered roller conveyors, provided these surfaces or conveyors are relatively level and free from projections. 6. Unboxed or uncrated warheads, depth bombs, depth charges, or other like rolled items shall not be tiered in "nesting up" drafts (hoists). 7. No "hard" or barrel hooks shall be used on this class of ammunition. 8. Depth charges and rocket heads that are not boxed or crated shall be loaded by use of pallet, skidboard or tray fitted with cargo net or sideboards. 9. Bombs, except depth bombs, may be loaded by use of wire rope slings, or by pallet, skidboard or tray fitted with cargo net or sideboards. 10. Depth bombs shall be loaded only by using pallet, skidboard, or tray fitted with cargo net or sideboards. (See § 146.29-39.) 11. Slings for use in hoisting this class of ammunition must be approved for use by the Captain of the Port. 12. Single slings made up in multiple assembly with spreader may be used in handling bombs that do not exceed 1,101 pounds each. Two legged slings shall be used in handling bombs of more than 1,101 pounds each. TABLE OF LIMITING LOADS (Applicable when handling bombs by sling method) Maximum units in one draft Weight of individual bomb or cluster. 1 lb. to 250 lbs.[1] ..... 8 276 lbs. to 500 lbs.[1] ..... 4 551 lbs. to 1,000 lbs.[1] ..... 2 1,101 lbs. to 2,000 lbs.[1] ..... 1 Over 2,200 lbs. ..... — [1] A tolerance of 10% per unit is allowed. (For example, a bomb weighing 550 lbs. may be considered as coming within the 500 lb. group.) 13. Naval mines, uncrated and fitted with lifting eye shall be loaded by using wire rope and shackle. 14. Naval mines, uncrated and not fitted with lifting eye may be loaded by use of wire rope slings or trays fitted with sideboards. 15. The following items when boxed or crated shall be loaded by the use of pallet, skidboard or tray fitted with cargo net or sideboards, photoflash bombs, antitank mines, antipersonnel mines, naval mines, warheads, depth charges, torpedo bangalore, projector charges and rocket heads. 16. Warheads, crated in such a manner that the nose lifting ring is exposed may be loaded by means of said ring. 17. The maximum permitted weight per draft, when handled by pallet, skidboard, tray or pedpiate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 18. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 19. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent, by means of sideboards or netting extended upward to the uppermost height of the draft, the upper tier or tiers from shifting or falling from the draft. 20. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
X-B						
Explosive bombs, mines, torpedoes, etc., packed with fuzes in integral package. (Fuzes will not detonate item with which packaged nor adjacent packages.)	Bombs, bomb clusters, mines, depth charges, warheads (fuzed and unfuzed), projector charges (unfuzed and without motors), torpedo bangalore (unfuzed), and other unfuzed ammunition filled with relatively large amounts of HE; all possessing a similar hazard characteristic of en masse detonation. The fuze is packed integral with the item, but the fuze will not detonate the item with which packaged nor adjacent packages. Includes but is not limited to: Bombs: Armor-piercing. Demolition. Depth. Depth charge. Fragmentation. GP. Photoflash (except M-122). SAP. Shallow water depth. Mines: Aerial. Aircraft. Anti-personnel (unfuzed). Anti-personnel fragmentation (unfuzed). Anti-tank (unfuzed). Anti-tank non-metallic (unfuzed). Grenade. High explosive. Land. Nuclear weapons (see para. 21 under "Handling"). Signals, underwater sound, w fuze. Torpedo bangalore. Torpedo warheads.	"Explosive bombs" "Explosive mines" "Explosive projectiles." "Explosive torpedoes."	A A A A	Fire and shock are the primary hazards to this class of ammunition. They are particularly dangerous because of their tendency to detonate en masse if involved in a fire or subjected to shock. Detonation will result in severe structural damage, increasing in severity and range in relation to the amount of high explosives involved. All high explosive loaded items in this class having thin container walls are relatively easily ruptured or dented. Denting of the container walls by impacts, though not sufficiently severe to rupture them has occasionally resulted in partial or complete detonation, and such kind of ammunition is said to possess "container-dent sensitivity." A certain degree of confinement combined with local heating of the contained explosive by a particular kind of impact apparently causes instantaneous explosive action. But whatever may be the actual mechanics of this phenomenon, the kinds of impacts known to have caused explosion of these items include such impacts as dropping on or striking against a rounded corner, similar to a hatch coaming, impact of one bomb against another, or being struck by handling and transportation equipment. In placing or removing dunnage, an accidental or misdirected blow from a sledge hammer, pinch bar or other hand tool may cause such explosions. The impact need not be violent. A short drop of only 2 feet caused a low order detonation of a depth bomb. Warheads, depth bombs, depth charges, Naval mines, and other like items are in the "Container-dent sensitivity" category. All of the foregoing also apply in substantial effect to containers of this class of ammunition that are not thin walled.	*AMMUNITION STOWAGE OR PORTABLE MAGAZINE* Class XB items shall not be stowed in the same hold or compartment with Class I items unless the two classes are separated by a partial bulkhead or a type "A" dunnage floor. Items in this class having thin container walls and said to possess "container-dent sensitivity" shall not be tiered one layer on top of another unless they are boxed, crated or dunnaged in such a manner that they are properly protected to withstand the superimposed weight. Items having thin walls and possessing "container-dent sensitivity" may be overstowed only with very light cargo such as bomb fin assemblies, empty water filled practice bombs and empty auxiliary gas tanks. Items of this class having thick walled containers may be tiered one layer on top of another provided they are so stowed, dunnaged, blocked and or braced as to prevent movement that is likely to damage the ammunition, the vessel or other cargo. Shall not be overstowed with inert compatible cargo having lesser bearing surface or greater unit weight than any item stowed below. Except for wooden barrels or boxes and fiberboard containers no flammable or combustible material as cargo or containers of same shall be stowed in a hold in which this class of ammunition is stowed. When photoflash items of this class are stowed with any other military explosive, including other items of this class, the two stowages must be separated by a partial bulkhead or type "A" dunnage floor. For stowage adjacent to other dangerous articles see § 146.29-59.	1. Handle by hand or mechanical means. 2. Do not drop, drag, slide, tumble, walk or otherwise subject these articles to shock. 3. Do not use chute in loading or unloading. 4. Cargo nets shall not be used except to enclose a pallet, skidboard, or tray, or as a preventor or save all. 5. Bombs, not crated or boxed, without external fittings or with external fittings protected by lug guards, may be rolled only under continuous hand control on level surfaces or on non powered roller conveyors, provided these surface or conveyors are relatively level and free from projections. 6. Unboxed or uncrated warheads, depth bombs, depth charges, or other thin walled items shall not be tiered in "nesting up" drafts (hoists). 7. No "cant" or barrel hooks shall be used on this class of ammunition. 8. Depth charges and rocket heads that are not boxed or crated shall be loaded by use of pallet, skidboard or tray fitted with cargo net or sideboards. 9. Bombs, except depth bombs, may be loaded by use of wire rope slings, or by pallet, skidboard or tray fitted with cargo net or sideboards. 10. Depth bombs shall be loaded only by using pallet, skidboard, or tray fitted with cargo net or sideboards. 11. Slings for use in hoisting this class of ammunition must be approved for use by the Captain of the Port. 12. Single slings made up in multiple assembly with spreader may be used in handling bombs that do not exceed 1,101 pounds each. Two legged slings shall be used in handling bombs of more than 1,101 pounds each. (See table of Limiting Loads, Class X-A). 13. Naval mines, uncrated and fitted with lifting eye shall be loaded by using wire rope and shackle. 14. Naval mines, uncrated and not fitted with lifting eye may be loaded by use of wire rope slings or trays fitted with sideboards. 15. The following items when boxed or crated shall be loaded by the use of pallet, skidboard or tray fitted with cargo net or sideboards, photoflash bombs, antitank mines, antipersonnel mines, naval mines, warheads, depth charges, torpedo bangalore, projector charges and rocket heads. 16. Warheads, crated in such a manner that the nose lifting ring is exposed may be loaded by means of said ring. 17. The maximum permitted weight per draft, when handled by pallet, skidboard, tray or preplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 18. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 19. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent, by means of sideboards or netting extended upward to the uppermost height of the draft, the upper tier or tiers from shifting or falling from the draft. 20. The limiting weights noted above are for a 5-ton boom. See § 146.29-41. 21. Nuclear weapons, warheads, and their components shall be handled and transported in accordance with pertinent military service directives.

X-C Guided missiles, solid propellant motors, packed with or without HE warheads.	Completely assembled missiles or rockets with DOT Class A and Class B solid fuel motors. Projector charges. Rocket motors, Class A.	"Rocket ammunition with explosive projectiles." Jato units, Class A. Jet, thrust units, Class A.	A or B A A	Fire and shock are the primary hazards to this class of ammunition. They are particularly dangerous because of (1) their tendency to detonate en masse if involved in a fire or subjected to shock, and (2) the combustibility and toxicity of the fuel if involved in a fire. All high explosive loaded items of this class having thin container walls are relatively easily ruptured or dented. Denting of the container walls by impact, though not sufficiently severe to rupture them may result in a partial or complete detonation. A certain degree of confinement combined with local heating of the contained explosive by a particular kind of impact causes instantaneous explosive action. These kinds of impacts are, striking against a rounded corner similar to a hatch coaming, impact of one missile against another, or being struck by handling or transportation equipment. Toxicity by inhalation of fumes is increased when fuels are ignited as the intensity of poisonous fumes is increased. Care should be exercised to minimize the exposure of personnel to the toxic effects of these mixtures and to prevent damage to the container with resulting leakage or spillage	AMMUNITION STOWAGE OR PORTABLE MAGAZINE Class XC items shall not be stowed in the same hold or compartment with Classes II-B IV and VII items unless the two classes are separated by a partition bulkhead or a type "A" dunnage floor. Except for wooden boxes or barrels and fiberboard containers, no flammable or combustible material shall be stowed in a hold or compartment in which this class of ammunition is stowed. Shall not be overstowed with any other kind of cargo. May be stowed on deck protected, except on the square of a hatch. For stowage adjacent to other dangerous articles see § 146.29-59	1. Handle by hand or mechanical means. 2. Do not drop, drag, slide, tumble, walk or otherwise subject these articles to shock. 3. Do not use chute in loading or unloading. 4. Cargo nets shall not be used except to enclose a pallet, skipboard, or tray, or as a preventer or save all. 5. Missiles, not crated or boxed, without external fittings or with external fittings protected by lug guards, may be rolled only under continuous hand control on level surfaces or on non-powered roller conveyors, provided these surfaces or conveyors are relatively level and free from projections. 6. Unboxed or uncrated missiles shall not be tiered in "making up" drafts (hoists). 7. No "cant" or barrel hooks shall be used on this class of ammunition. 8. May be loaded by use of wire rope slings, or by pallet, skipboard or tray fitted with cargo net or sideboards. 9. Slings for use in hoisting this class of ammunition must be approved for use by the Captain of the Port. 10. Single slings made up in multiple assembly with spreader may be used in handling missiles that do not exceed 1,101 pounds each. Two legged slings shall be used in handling missiles of more than 1,101 pounds each. (See table of Limiting Loads, Class X-A) 11. The maximum permitted weight per draft, when handled by pallet, skipboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 12. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 13. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent, by means of sideboards or netting extended upward to the uppermost height of the draft, the upper tier or tiers from shifting or falling from the draft. 14. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

For explanation of abbreviations and reference marks, see last page of this tariff.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
X-D Guided missiles, liquid propellant motors, packed with HE warheads.	Completely assembled missiles or rockets with liquid petroleum fueled motors.	"Rocket ammunition with explosive projectiles."	A	Fire and shock are the primary hazards to this class of ammunition. They are particularly dangerous because of (1) their tendency to detonate en masse if involved in a fire or subjected to shock, and (2) the combustibility and toxicity of the fuel if involved in a fire. All high explosive loaded items of this class having thin container walls are relatively easily ruptured or dented. Denting of the container walls by impact, though not sufficiently severe to rupture them, may result in a partial or complete detonation. A certain degree of confinement combined with local heating of the contained explosive by a particular kind of impact causes instantaneous explosive action. These kinds of impacts are, striking against a rounded corner, similar to a hatch coaming, impact of one missile against another, or being struck by handling or transportation equipment. Toxicity by inhalation of fumes is increased when fuels are ignited as the intensity of poisonous fumes is increased. Care should be exercised to minimize the exposure of personnel to the toxic effects of these mixtures and to prevent damage to the container with resulting leakage or spillage.	*AMMUNITION STOWAGE* Class X-D items shall not be stowed in the same hold or compartment with other military explosives, other dangerous cargo, or regulated items. Shall be stowed only in a lower hold, or "On deck protected," not on the square of a hatch. Shall not be overstowed. For stowage adjacent to other dangerous articles see § 146.29-58. Must be stowed so that superstructure intervenes between it and other items that require "On deck" stowage. Preferred "On deck" stowage is aft. Missiles with liquid petroleum fueled motors may be stowed at any level in any hatch provided leakage of the fuel will drain directly into the bilges.	1. Handle by hand or mechanical means. 2. Do not drop, drag, slide, tumble, walk or otherwise subject these articles to shock. 3. Do not use chute in loading or unloading. 4. Cargo nets shall not be used except to enclose a pallet, skidboard, or tray, or a preventor or save all. 5. Missiles, not crated or boxed, without external fittings or with external fittings protected by lug guards, may be rolled only under continuous hand control on level surfaces or on non-powered roller conveyors, provided these surfaces or conveyors are relatively level and free from projections. 6. Uncrated or uncrated missiles shall not be tiered in "making up" drafts (hoists). 7. No "cant" or barrel hooks shall be used on this class of ammunition. 8. May be loaded by use of wire rope slings, or by pallet, skidboard or tray fitted with cargo net or sideboards. 9. Slings for use in hoisting this class of ammunition must be approved for use by the Captain of the Port. 10. Single slings made up in multiple assembly with spreader may be used in handling missiles that do not exceed 8,101 pounds each. Two legged slings shall be used in handling missiles of more than 8,101 pounds each. (See table of Limiting Loads, Class X-A). 11. The maximum permitted weight per draft, when handled by pallet, skidboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 12. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 13. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent, by means of sideboards or netting extended upward to the uppermost height of the draft, the upper tier or tiers from shifting or falling from the draft. 14. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

X-E Rocket engines, liquid	Rocket engines containing a liquid propellant, a hypergolic fuel oxidizer combination which is shipped separately packaged within the rocket engine. The igniter booster is also shipped as an integral part of the rocket engine. Includes but is not limited to Bullpup rocket engine.	Rocket engines (liquid), Class B explosives.	B	Fire can cause the engines to liberate dangerous toxic gases. Such gases (or smoke) are dangerous if allowed to become airborne contaminators, or to be ingested or inhaled into the body. Use copious amounts of water to combat fires or leaters. Fire extinguishers containing carbon dioxide, carbon tetrachloride, or dry powder should not be used. Normal fire fighting equipment is less useful, since the blanketing or smothering is less effective because the oxidizers supply their own oxygen. In case of fire, or if leaky containers are discovered, personnel should use protective clothing.	"On deck protected" Class X-E items shall not be stowed in the same hold or compartment with other military explosives. Ammunition stowage in a lower hold or deep tank if the space is equipped with a sprinkler system. Shipments stowed on deck shall be last on first off shipments on board the vessel. Shipments stowed on deck shall be last on first off shipments on board the vessel. On vessels having the bridge structure amidship, the holds separated by the bridge structure from the Class X-E explosives stowage may be worked. Adequate fire hose, adjacent to the stowage area, shall be readily accessible to ship's personnel. The on deck stowage shall be isolated from other deck cargo. It shall be separated from other military explosives, hazardous munitions or dangerous cargoes on deck by the bridge structure. Stowage on deck shall not be over the square of the hatch.	1. Observe containers for evidence of leakage and reject any showing such signs. 2. Handle by hand or mechanical means using extreme care against damage to the container. 3. Do not drop, drag, tumble, wash or otherwise subject packages to shock. 4. Packages shall be stowed in the position indicated by their markings. 5. Do not use chute in loading or unloading. 6. In the event of damage to a container resulting in leakage or spillage, stop operations, clear area of all personnel, render first aid to personnel affected and spray copious amount of water on area affected. Decontamination must be handled by personnel trained in this procedure and equipped with protective clothing and self contained breathing apparatus. 7. Four complete sets of acid-resistant protective clothing, including a self-contained breathing apparatus of an approved type, must always be immediately available for emergency use. In this operation, as well as all other operations involving fuming nitric acid, treadle type of deluge showers and a container of approximately 5% solution of acetic acid or strong vinegar must be available. 8. Weight per draft shall not exceed 2,400 pounds plus 10% using a five ton boom. Single items of this class, or assembled units designed to be handled as a unit, may be loaded regardless of weight provided the cargo handling gear is of a design capable of handling a working load at least 50 percent additional to the actual weight of the item or unit comprising the draft and provided further the integrity of the cargo handling gear is unimpaired. 9. Must be loaded first on the side away from the pier so that motors being loaded do not pass over those already loaded.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
10 A						
Chemical ammunition, lethal	Chemical ammunition filled with lethal gases such as mustard gas (H), lewisite gas (L), nerve gas (GB and VX), BNT agents, phosgene gas (CG), hydrocyanic acid (AC), nitrogen mustard gas (HN), dichlorgene (DF), chloropicrin gas (PS), cyanogen chloride (CK) when shipped assembled with or without their ignition elements, bursting charges or fuzes. When these substances are shipped in drums, barrels, cylinders or other authorized containers they shall be classified Class A Poison Gas. When these substances are shipped in authorized DOT specification containers or Army Materiel Command specification containers of integrity equal to DOT containers (including projectiles, bombs and rockets without ignition elements, bursting charges or fuzes) they may be handled and stowed either as Class A poison gas or chemical ammunition Class 10 A. Includes but is not limited to the following items when filled with any of the above agents: Ammunition for guns with gas projectile Bombs, chemical Bombs, clusters, chemical Frangible grenade Hand grenade Howitzer projectile Land mine Mortar projectile Rockets, chemical Separate loading projectile Note: The Army Materiel Command or U.S. Navy, when shipping chemical ammunition, mark such ammunition and the containers thereof, in general, as follows: (a) By the use of color bands painted upon the ammunition the containers thereof, by letter symbol to indicate the particular kind of chemical therein and the word "Gas" stenciled upon the ammunition of the containers thereof. (b) Persistent gases are marked with two (2) green bands. Nonpersistent gases with one (1) green band. (c) The word "Gas" will be stenciled upon projectiles and upon the outside container of projectiles, grenades, bombs, candles, etc., the stenciling to be of the same color as the designating band. (d) The bodies of all ammunition containing gas will be painted gray.	"Ammunition for cannon with gas projectile." "Explosive bomb" "Explosive projectile." Explosive mine." "Hand grenade" "Rifle grenade" "Rocket ammunition with gas projectile." Shipping name of item when shipped as Class A poison.	A A A A A A A Poison A	This type of ammunition or bulk shipments of these substances in containers other than ammunition, represents a particular and special hazard. Minute quantities of either liquid or vapor can cause serious burns and death. The liquid or vapor will contaminate everything with which it comes in contact, cause serious and painful burns to exposed portions of the body and the eyes, and attack the respiratory system usually with fatal results. Nerve gas is highly toxic, quick acting nerve poison. It can be absorbed through any body surface including the respiratory tract, skin, eyes, and gastrointestinal tract. The rapidity of action of nerve gas and absence of identifying symptoms may incapacitate a person so rapidly that he may be unable to take individual protective measures.	*CHEMICAL AMMUNITION STOWAGE, SPECIAL STOWAGE, OR PORTABLE MAGAZINE* Bulk shipments of chemical agents in DOT cylinders, tanks or Army Materiel Command specification containers of integrity equal to DOT containers may be stowed in a shelter deck space or in a deck house suitable for such stowage. Chemical ammunition (explosive) shall be stowed in a deep tank, lower hold or between deck, and such stowage shall be effectively sealed off to prevent the escape of any leakage which may take place. (See § 146.29-85.) Drums or other authorized DOT or Army Materiel Command specification containers filled with Class A poison gas may be stowed in the same hold or compartment with chemical ammunition Class 10 A. For stowage adjacent to other dangerous articles see § 146.29-59. May be loaded at a temporary location authorized by the Captain of the Port for the specific loading. When given chemical ammunition stowage, see § 146.29-85 for additional requirements.	When possible and the amount of such ammunition or containers of these chemical substances warrants, a technical representative of the appropriate Department of Defense technical service shall be present during the loading and stowage. 1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Shall not be rolled except under hand control and on a level surface without appreciable incline. 5. Packages shall be braced so as to prevent any movement. Top tiers shall be braced to prevent upward movement. 6. Packages or containers shall be stowed in the position indicated by their markings. When not so marked, boxes shall be stowed on the most stable side and arranged in such a manner that the joints between boxes are staggered. 7. No packages shall be "cant" stowed. 8. Dunnage shall be applied to the sides, ends and tops of the boxes before bracing is applied. 9. Cargo handling stevedore gear may be trays, skipboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with removable sides are authorized. 10. Cargo nets without trays, skipboards, pallets or pieplates are not permitted. 11. Wire rope slings are permitted when handling unboxed bombs or containers filled with this class of chemical warfare material. 12. The maximum permitted weight per draft when handled by tray, skipboard, pallet, or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 13. Single bombs or other unit containers weighing in excess of 2,200 lbs. must be loaded or unloaded one at a time. 14. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 15. Lifts of palletized units shall not be hoisted except when using a sling so designed as to prevent, by means of sideboards or netting extended upward to the uppermost height of the draft, the upper tier or tiers from shifting or falling from the draft. 16. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

10-8 Chemical ammunition, nonlethal	Chemical ammunition filled with non-lethal gases such as Chloracetophenone gas (CN), Chloracetophenone solution (CNS) or (CNS), Bromobenzylcyanide (BBC) and Adamsite (DM), when shipped assembled with or without their ignition elements, bursting charges or fuzes. When these substances are shipped in drums, barrels, cylinders or other authorized containers, they shall be classified as tear gasses or irritating substances, Class C—poisons. When these substances are shipped in authorized DOT specification containers or Army Materiel Command containers of integrity equal to DOT containers (including projectiles, bombs and rockets, without ignition elements, bursting charges or fuzes) they may be handled and stowed either as Class C—poisons or as chemical ammunition Class 10-8. Includes but is not limited to the following items when filled with any of the above agents: Ammunition for cannon with gas projectile Bombs, aircraft Bombs, aircraft cluster CN capsules Gas identification sets Grenades, hand Grenades, liangible, hand Grenades, rifle Rockets Projectiles, mortar Tear gas candles Tear gas pots Note: The U.S. Army and Navy when shipping harassing gas ammunition, mark such ammunition and the containers thereof with the word "gas" and Army Materiel Command symbol of the gas with one red band.	"Ammunition for cannon with gas projectiles." "Explosive bomb" "Explosive projectile." "Hand grenade" "Rifle grenade" "Tear gas candle" "Tear gas grenade" "Rocket ammunition with gas projectile." Shipping name of item when shipped as Class C poison.	A A A A A Pois. C Pois. C A Pois. C	Fire and intolerable vapors. The fire hazard of some of these items is similar to that of smokeless powder. The vapors are rarely lethal as concentrations far below the lethal range are intolerable. Gas mask provides complete protection.	*CHEMICAL AMMUNITION STOWAGE, SPECIAL STOWAGE, OR PORTABLE MAGAZINE* It is important to stow in locations not subject to temperatures above 150° F. Stowage shall be accessible from cargo hatch or other access means to the hold or compartment. Drums or other authorized DOT or Army Materiel Command specification containers filled with Class C poison gas may be stowed in the same hold or compartment with chemical ammunition, Class 10-8. For stowage adjacent to other dangerous articles see § 146.29-59. May be loaded at a temporary location authorized by the Captain of the Port for the specific loading. When given chemical ammunition stowage, see § 146.29-85 for additional requirements.	When possible and the amount of such ammunition or containers of these chemical substances warrants, the loading and stowage of chemical ammunition or chemical agents for such should be supervised by a representative of the appropriate Department of Defense technical service. 1. Handle by hand or mechanical means. 2. Do not drop, drag, tumble, walk or otherwise subject packages to shock. 3. Do not use chute in loading or unloading. 4. Shall not be rolled except under hand control and on a level surface without appreciable incline. 5. Packages shall be braced so as to prevent any movement. Top tiers shall be braced to prevent upward movement. 6. Packages or containers shall be stowed in the position indicated by their markings. When not so marked, boxes shall be stowed on the most stable side and arranged in such a manner that the joints between boxes are staggered. 7. No packages shall be "cant" stowed. 8. Dunnage shall be applied to the sides, ends and tops of the boxes before bracing is applied. 9. Cargo handling stevedore gear may be trays, skipboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with removable sides are authorized. 10. Cargo nets without trays, skipboards, pallets, or pieplates are not permitted. 11. Wire rope slings are permitted when handling unboxed bombs or containers filled with this class of chemical warfare material. 12. The maximum permitted weight per draft when handled by tray, skipboard, pallet or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs. plus 10%. 13. Single bombs or other unit containers weighing in excess of 2,200 lbs. must be loaded or unloaded one at a time. 14. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 15. Lifts of palletized units shall not be bend except when using a sling so designed as to prevent, by means of sideboards or netting extended upward to the uppermost height of the draft, the upper tier or tiers from shifting or falling from the draft. 16. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

§146.29-100 Classification, handling and stowage chart—*(Continued)*

Class	Description	DOT Marking	DOT Class	Hazard	Stowage	Handling
JO-C Fuels in containers for guided missiles and rockets	Missile fuels are usually non-corrosive, highly combustible mixtures, shipped in drums of aluminum or glass containers, used as fuels for guided missiles or rockets. Includes but is not limited to: Acetonitrile (methyl cyanide). Aluminum borohydride. Anhydrous ammonia. Aniline. Diborane. Diethylene triamine. Diethylene glycol dinitrate, liquid. Dimethyl hydrazine, unsymmetrical Ethyl alcohol. Furfuryl alcohol. Gasoline (AVGAS). Heptane. Hydrazine. Hydrazine hydrate. Kerosene. Liquid fluorine Liquid hydrogen. Methyl alcohol. Monoethylaniline. Nitroglycerine, liquid. Nitromethane. Octane. Pentaborane. Pentane. Potassium cuprocyanide. Tetranitromethane.	Shipping name of item.	FG., FL., FS., Oxi M., Nonfl G. Pois B	The principal hazard is its involvement in a fire since all of the fuels are highly combustible and toxic and under certain conditions will explode. Aniline furfuryl alcohol mixtures are toxic through inhalation of the fumes or vapors, ingestion, and absorption through the skin. Toxicity by inhalation of fumes is increased when fuels are ignited as the intensity of poisonous fumes is increased. Care should be exercised to minimize the exposure of personnel to the toxic effects of these mixtures and to prevent damage to the containers with resulting leakage or spillage.	This class will not be stowed with any corrosive liquid (acids, etc.), oxidizing agents, or explosives. For stowage adjacent to other dangerous articles see § 146.29-59. May be stowed "On deck" and protected from direct rays of the sun and inclement weather, or may be stowed in a deep tank and such stowage shall be effectively sealed off to prevent the escape of any leakage which may take place. Pertinent parts of § 146.29-85 apply. Compatibility of items within this class shall be in accordance with § 146.29-99, Chart B. Must be stowed so that superstructure intervenes between it and other items that require "On deck" stowage. This requirement also applies to non-compatible items within this class. Preferred "On deck" stowage is aft. Drums may be tiered 2-high by use of metal dunnage of aluminum. When stowed on deck, the weather deck must be tight and the cargo hatch fitted with a tight raised coaming. The stowage must be accomplished by means of a crib and a platform so constructed as to provide a free space of at least six inches in height between the deck and the floor of the crib in such a manner as to allow flushing of any leakage that may occur. The stowage must not be made over the square of the hatch. If stowed aboard a vessel carrying no other military explosives, see § 146.29-11(b).	When possible, and the amount of substance warrants, the loading and stowage of fuels should be supervised by a representative of the appropriate Department of Defense technical service. 1. Handle by hand or mechanical means using extreme care against damage to the container resulting in leakage or spillage. 2. Do not drop, drag, tumble, walk or otherwise subject packages or drums to shock. Drums will not be rolled. 3. Packages shall be stowed in the position indicated by their markings, drums and kegs shall be stowed on end with bung holes up. 4. Do not use chute in loading or unloading. 5. Observe packages or drums for leakage or spillage and for odor of aniline or alcohol in the case of aniline furfuryl alcohol shipments. If no odor is present and no evidence of leakage is present, the shipment is assumed to be in safe working condition and the cargo can be handled by personnel wearing the usual type of leather gloves and safety shoes. No other type of protective clothing will be required, however, in this operation as well as all other operations involving aniline furfuryl alcohol mixtures, the safe type of deluge shower and a container of approximately 5% solution of acetic acid or strong vinegar must be available. 6. In the event of damage to a container resulting in leakage or spillage, stop operations, clear area of all personnel, render first aid to personnel affected and spray copious amount of water on area affected. Decontamination must be handled with a minimum delay by personnel trained in this procedure and equipped with protective clothing and self-contained breathing apparatus. 7. Cargo handling stevedore gear may be trays, skidboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays with fixed or removable sides are authorized. 8. Cargo nets without trays, skidboards, pallets or pieplates are not permitted. 9. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent, by means of sideboards or netting extended upward to the uppermost height of the draft, the upper tier or tiers from shifting or falling from the draft. 10. The maximum permitted weight per draft, when handled by pallet, skidboard, tray or pieplate fitted with cargo nets or sideboards shall not exceed 2,400 lbs. plus 10%. 11. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 12. The limiting weights noted above are for a 5-ton boom. See § 146.29-41.

xo-O Oxidizers in containers for guided missiles and rockets.	Oxidizers for use with guided missiles and rockets are non-flammable liquids; however, they are strong oxidizers and if allowed to come in contact with readily organic materials or metallic powders, may cause spontaneous combustion. They are highly toxic producing poisonous vapors and fumes and capable of producing severe burns or death if improperly handled. Fuming nitric acid vigorously attacks most metals, particularly iron and steel. Includes but is not limited to: Compressed gas, oxygen. Hydrogen peroxide. Liquid nitrogen tetroxide. Liquid oxygen. Mixed acid (nitric-sulfuric) Red nitric acid, fuming. White nitric acid, fuming	Shipping name of item.	Cat I. Nonl. G Oxy M.	The principal hazards arise from the combustibility of organic materials when in contact with acids and the toxicity of fumes and vapors produced. The oxides of nitrogen, referred to as "nitrous fumes" if inhaled in appreciable quantities, may cause severe damage to respiratory and pulmonary tissues and, under certain conditions, may result in death. Color of the fumes is not an index to their toxicity. All nitric acid fumes are dangerous. Contact with the skin results in severe burns and may result in permanent scars or deformity. Contact with the eyes may cause blindness. Red Fuming Nitric Acid (RFNA) is not flammable in itself and cannot be detonated, but the combustibility of all organic material is greatly increased in contact with this acid. This acid is very hygroscopic (completely soluble), and its introduction INTO water will cause rapid evolution of heat with spattering of the acid. RFNA vigorously attacks most metals, particularly iron and steel. Nitric acid will react with salt water to liberate chlorine and other poisonous gases. Winterized water fire extinguishers containing salt as a freezing point depressant, should not be used to fight fires involving nitric acid. The use of large quantities of water, as a spray rather than a stream, to dilute the acid and extinguish the fire, is effective. Fire extinguishers of a suitable type should be provided wherever this acid is handled or stowed.	This class will not be stowed with any inflammable liquid fuels, metallic powders, or explosives. For stowage adjacent to other dangerous articles see § 146.29-59. May be stowed "On deck" and protected from direct rays of the sun and inclement weather, or may be stowed in a deep tank and such stowage shall be effectively sealed off to prevent the escape of any leakage which may take place. Pertinent parts of § 146.29-85 apply. Compatibility of items within this class shall be in accordance with § 146.29-99, Chart B. Must be stowed so that superstructure intervenes between it and other items that require "On deck" stowage. This requirement also applies to non-compatible items within this class. Preferred "On deck" stowage is aft. Drums may be tiered 2 high by use of metal dunnage of aluminum. When stowed on deck, the weather deck must be light and the cargo hatch fitted with a light raised coaming. The stowage must be accomplished as to provide a free space of at least six inches in height between the deck and the floor of the crib in such a manner as to allow flushing of any leakage that may occur. The stowage must not be made over the square of the hatch. If stowed aboard a vessel carrying no other military explosives, see § 146.29-11(b).	When possible, and the amount of substance warrants, the loading and stowage of oxidizers and acids should be supervised by a representative of the appropriate Department of Defense technical service. 1. Handle by hand or mechanical means using extreme care against damage to the container resulting in leakage or spillage. 2. Do not drop, drag, tumble, walk, or otherwise subject packages or drums to shock. Drums will not be rolled. 3. Packages shall be stowed in the position indicated by their markings; drums and kegs shall be stowed on end with bung holes up. 4. Do not use chute in loading or unloading. 5. Visually inspect packages or drums for evidence of spillage or leakage and for odor of nitrous dioxide fumes in the case of fuming nitric acid shipments. If no odor is detected and no fumes are visible, the shipment is assumed to be in safe working condition and the cargo can be handled by personnel wearing gloves and aprons of acid-resistant material, safety shoes and eye goggles. No other type of protective clothing will be required, however, two complete sets of acid-resistant protective clothing, including a self-contained breathing apparatus, of an approved type, must always be immediately available for emergency use. In this operation, as well as all other operations involving fuming nitric acid, a safe type of deluge showers and a container of approximately 5% solution of acetic acid or strong vinegar must be available. 6. In the event of damage to a container resulting in leakage, spillage or fumes, stop operations, clear area of all personnel, render first aid to personnel affected and spray copious amount of water on area affected. Decontamination must be handled with a minimum delay by personnel trained in this procedure and equipped with approved type of protective clothing and self-contained breathing apparatus. Damaged containers will be removed only by such personnel. 7. Cargo handling slevedore gear may be trays, skidboards, pallets, or pieplates provided they are fitted with cargo nets or sideboards. Boxes or trays fitted with fixed or removable sides are authorized. 8. Cargo nets without trays, skidboards, pallets or pieplates are not permitted. 9. Lifts of palletized units shall not be tiered except when using a sling so designed as to prevent, by means of sideboards or netting extended upward to the uppermost height of the draft, the upper tier or tiers from shifting or falling from the draft. 10. The maximum permitted weight per draft, when handled by pallet, skidboard, tray or pieplate fitted with cargo net or sideboards shall not exceed 2,400 lbs plus 10%. 11. Drafts consisting of one or more palletized units shall not exceed 4,000 lbs. plus 10%. 12. The limiting weights noted above are for a 5 ton boom. See § 146.29-41.

IM TANK TABLE

A TABLE LISTING HAZARDOUS MATERIALS APPROVED BY THE ASSOCIATE DIRECTOR FOR HAZARDOUS MATERIALS REGULATION, MATERIALS TRANSPORTATION BUREAU, FOR CARRIAGE IN INTERMODAL PORTABLE TANKS UNDER SPECIFIED CONDITIONS.

U.S. DEPARTMENT OF TRANSPORTATION

RESEARCH AND SPECIAL PROGRAMS ADMINISTRATION
MATERIALS TRANSPORTATION BUREAU

January 1, 1981

This Table must be used in conjunction with the regulations that apply to the use of IM portable tanks set forth in 49 CFR Parts 171–189 and specifies additional conditions under which a hazardous material is approved for transportation in a specification IM 101 or IM 102 portable tank (see § 173.32c).

The most recent IM Tank Table and any subsequent amendments are available from the Dockets Branch (DCA-22), Research and Special Programs Administration, U.S. Department of Transportation, Washington, D.C. 20590. The Dockets Branch is located in Room 8426 of the Nassif Building, 400 Seventh Street, S.W., Washington, D.C. The office hours are 8:00 a.m. to 4:30 p.m., Monday thru Friday.

Procedures for adding, deleting, or modifying materials to the IM Tank Table

Any person seeking to add to or change an entry in the IM Tank Table must submit an application to the Associate Director for Hazardous Materials Regulation (DMT-20), Materials Transportation Bureau, Washington, D.C. 20590 (see 49 CFR 173.32d). Each application, submitted in duplicate and titled "Proposed Addition (or Change) to IM Tank Table," must contain the following information:

a. Name and address of applicant.
b. Name and address of USA representative if applicant is based in a foreign country.
c. Information concerning material:
   1. Common industrial name.
   2. Chemical name.
   3. DOT shipping name.
   4. DOT hazard class.
   5. UN hazard class.
   6. UN number.
   7. Specific gravity at 20°C (water taken as 1).
   8. Absolute vapor pressure (psia or mm Hg) at 50°C.
   9. Boiling point (°C).
   10. Flash point (°C) closed cup (specify method).
   11. Is material pyrophoric?
   12. Does material require inert gas atmosphere?
   13. Coefficient of thermal expansion.
   14. Total emergency venting capacity required for tank in standard cubic feet per hour calculated in accordance with formulas in CGA Pamphlet S-1.2, IMCO CODE, Volume II, paragraph 13.1.13.6.3 or UN Recommendations on Multimodal Tank Transport, paragraph 12.13.2. Calculations must be provided.
   15. Toxicity:
      (i) Oral LD_{50}
      (ii) Dermal LD_{50}
      (iii) Inhalation LC_{50}
      (iv) Is material considered a lachrymater?
   16. Corrosivity:
      (i) Skin (apply test prescribed in § 173.240)
      (ii) Steel (1020) at 55 C (mm/yr.).
      (iii) Aluminum (7075 T-6) at 55 C (mm/yr.).
      (iv) Metal of which tank is constructed at 55 C (mm/yr.).
   17. Stability:
      Does material require inhibition or stabilization?
      If yes, what is:
      (i) Inhibitor or stabilizer.
      (ii) Duration of effectiveness.
d. Applicant's proposals concerning:
   1. IM tank type (101 or 102).
   2. Design pressure.
   3. Type of pressure relief devices.
   4. Bottom outlets.
   5. Minimum shell thickness.

Use of the Table

(a) Locate the proper shipping name of the material in 49 CFR 172.101.
(b) Follow across the Hazardous Materials Table in § 172.101 to column (5)(b) for section(s) referenced in Part 173.
(c) Check the sections referenced in Part 173 to determine if IM portable tanks are authorized for the material.
(d) If a referenced section contains an authorization for an IM portable tank, locate the most specific and appropriate description of the material in the IM Tank Table. Some descriptions listed in the IM Tank Table are not proper shipping names. A material described by an "n.o.s." entry in § 172.101 may be listed in the IM Tank Table by a general description or by a technical name, or both. (For example, "Flammable liquid, n.o.s." in § 172.101 is listed in the IM Tank Table as "Flammable liquids not listed by name in this table." Where both the technical description and a general description of a material are listed, the technical description must be used, in determining the specific requirements of the IM Tank Table that are applicable.

Outage

Section 173.32c specifies that the outage in an IM portable tank may not be less than 2 percent at a temperature of 50°C (122°F). The maximum extent to which a tank may be filled with liquid at a filling temperature (t_f) to insure that the minimum 2% outage is maintained may be determined by the following formula:

Maximum filling density at $t_f = 98/(1 + a(T_r - T_f))$
(percent by volume)

Where:

a = mean coefficient of cubical expansion of the liquid between temperatures t_f and T_r and may be determined as follows:

For metric units
$a = (d_{15} - d_{50})/(35\ d_{50})$
For nonmetric units
$a = (d_{59} - d_{122})/(63\ d_{122})$

T_r = maximum temperature of the liquid in the tank 50°C (122°F.)
t_f = actual temperature of the liquid in the tank in °C or °F as appropriate
d_{15} = density of the liquid at 15°C.
d_{50} = density of the liquid at 50°C.
d_{59} = density of the liquid at 59°F.
d_{122} = density of the liquid at 122°F.

Format of IM Tank Table

(a) Column (1) provides the description of the hazardous material. These descriptions are to be used to determine required construction features on tanks which contain a material meeting the description, but *may not* be used on shipping papers in place of the appropriate proper shipping name (see § 172.203(1)).
(b) Column (2) contains Identification Numbers (UN or NA).
(c) Column (3) specifies the IM specification tank required.
(d) Column (4) specifies the lowest Maximum Allowable Working Pressure (MAWP) in bars required for the tank. The equivalent pressures in psig is as follows:
1.0 bar = 14.5 psig 2.67 bar = 38.7 psig
1.75 bar = 25.4 psig 4.0 bar = 58.0 psig
(e) Column (5) specifies the type of pressure relief devices arrangement required on the tank. Hazardous materials authorized for transport in a tank fitted with a "Normal" pressure relief device arrangement are also authorized for transport in a tank fitted with a "Special" pressure relief device arrangement.
(1) "Normal"—Means that 178.270-11 (a)(1) or (2) applies.
(2) "Special"—Means that, in addition to the requirements of § 178.270-11 (a)(1) or (2), a frangible disc shall be used in

For explanation of abbreviations and reference marks, see last page of this tariff.

series with the required relief valve. This arrangement of the relief valve and frangible disc must conform to § 178.270-11(a)(3). However, a frangible disc is not required for tanks in dedicated service if the relief valve is corrosion resistant to, and otherwise compatible with, the lading.

(f) Column (6) provides requirements for the arrangement of bottom openings:

(1) "Prohibited"—Means bottom openings are prohibited.

(2) "A"—Means bottom openings having two serially mounted closures as provided in 49 CFR 173.32c(g)(1) are authorized;

(3) "B"—Means each filling or discharge connection located below the normal liquid level of the tank, or compartment thereof, must have three serially-mounted closures as provided in 49 CFR 173.32c(g)(2). The three closures shall consist of an internal discharge valve capable of being closed from a location remote from the valve itself, an external valve, and a bolted blank flange or other suitable, liquid-tight closure on the outlet side of the external valve.

(4) Hazardous materials authorized for transport in a tank fitted with bottom outlets having two serially mounted closures are also authorized for transport in a tank fitted with three serially mounted closures and in tanks fitted with no bottom outlets. Similarly, hazardous materials authorized for transport in tanks fitted with bottom outlets having three serially mounted closures are also authorized for transport in tanks fitted with no bottom outlets.

(g) Column (7) provides requirements for minimum shell thickness:

(1) "Standard"—Means the requirements of 49 CFR 178.270-5 or 49 CFR 178.272-2 apply as appropriate;

(2) When a specific thickness is specified it is the actual specified minimum shell and head thickness in mild steel and the requirements of 49 CFR 178.270-5(d) apply.

(3) Hazardous materials authorized for transport in a tank with a standard shell thickness are also authorized for transport in a tank of greater specified minimum thickness.

(h) Column (8) contains reference to special provisions specified in this paragraph as follows:

"a" means a nitrogen or other inert gas blanket is required.

"b" means a 5mm lead lining, or other suitable lining materials approved by the Associate Director for HMR, is required.

(1) Hazardous Materials Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Acetal	UN 1088	101	1.75	Normal	A	Standard	
Acetaldehyde	UN 1089	101	4.0	Normal	B	6.35 mm	a
Acetaldehyde oxime	UN 2332	101	1.75	Normal	B	Standard

Chlorotoluenes	UN 2238	102	1.0	Normal	A	Standard	
Chlorotoluidines	UN 2239	101	1.75	Normal	A	Standard	
Chromic acid, solution	UN 1755	101	1.75	Normal	C	8 mm	
Chromic fluoride, solution	UN 1757	101	1.75	Normal	B	Standard	
Chromium oxychloride [or] Chromyl chloride	UN 1758	101	1.75	Special	Prohibited	6.35 mm	
Chromosulfuric acid	UN 2240	101	1.75	Special	Prohibited	8 mm	
Coal tar distillate							
(a) Flashpoint below 32 deg F	UN 1136	101	1.75	Normal	B	Standard	
(b) Flashpoint 32 deg F or above	UN 1137	102	1.0	Normal	A	Standard	
Coating solution							
(a) Flashpoint below 32 deg F	UN 1139	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1139	102	1.0	Normal	A	Standard	
Combustible liquid, not listed by name in this table	Various	102	1.0	Normal	A	Standard	
Corrosive liquid, not listed by name in this table ([vapor pressure not greater than 43 psia at 122 deg F and no subsidiary hazards])							
(a) Causing irreversible damage to tissue in 3 minutes or less	Various	Must be specifically authorized prior to transportation. See 49CFR173.32c(d)					
(b) Causing irreversible damage to tissue in greater than 3 minutes but in not more than one hour	Various	101	2.67	Normal	B	Standard	

(1) Hazardous Material's Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
(c) Liquids not in (a) or (b) above	Various	101	1.75	Normal	A	Standard	
Cresols	UN 2076	101	1.75	Normal	B	Standard	
Cresylic acid	UN 2022	101	1.75	Normal	B	Standard	
Crotonaldehyde, [stabilized]	UN 1143	101	1.75	Normal	B	Standard	
Crotonylene	UN 1144	101	4.0	Normal	B	Standard	
Crude oil [See] Petroleum crude oil							
Cuprietylene diamine, solution	UN 1761	101	1.75	Normal	B	6.35 mm	
Cyanide solutions	UN 1935	101	2.67	Special	Prohibited	6.35 mm	
Cyanogen bromide	UN 1889	Not authorized for transportation in IM101 or IM102 tanks					
Cyclobutyl chloroformate	UN 2744	101	2.67	Special	Prohibited	Standard	
1,5,9 Cyclododecatriene	UN 2518	101	1.75	Normal	A	Standard	
Cycloheptane	UN 2241	102	1.0	Normal	A	Standard	
Cycloheptatriene	UN 2603	101	2.67	Normal	B	Standard	
Cycloheptene	UN 2242	101	1.75	Normal	A	Standard	
Cyclohexane	UN 1145	101	1.75	Normal	B	Standard	
Cyclohexanone	UN 1915	102	1.0	Normal	A	Standard	
Cyclohexene	UN 2256	101	1.75	Normal	A	Standard	
Cyclohexenyltrichlorosilane	UN 1762	101	1.75	Normal	B	6.35 mm	
Cyclohexyl acetate	UN 2243	102	1.0	Normal	A	Standard	
Cyclohexylamine	UN 2357	101	1.75	Normal	B	6.35 mm	
Cyclohexyl isocyanate	UN 2488	101	1.75	Normal	B	Standard	
Cyclohexyltrichlorosilane	UN 1763	101	1.75	Normal	B	6.35 mm	
Cyclooctadienes	UN 2520	102	1.0	Normal	A	Standard	
Cyclooctatetraene	UN 2358	101	1.75	Normal	B	Standard	
Cyclopentane	UN 1146	101	2.67	Normal	B	Standard	
Cyclopentanol	UN 2244	102	1.0	Normal	A	Standard	
Cyclopentanone	UN 2245	102	1.0	Normal	A	Standard	
Cyclopentene	UN 2246	101	2.67	Normal	A	Standard	
Cymenes	UN 2046	102	1.0	Normal	A	Standard	
Decahydronaphthalene	UN 1147	102	1.0	Normal	A	Standard	
n-Decane	UN 2247	102	1.0	Normal	A	Standard	
Di (2-ethylhexyl) phosphoric acid [See] Diisooctyl acid phosphate							
Diacetone alcohol	UN 1148	102	1.0	Normal	A	Standard	
Diacetyl (2,3-butanedione))	UN 2346	102	1.0	Normal	A	Standard	
Dialylamine	UN 2359	101	1.75	Normal	B	Standard	
Diallyl ether	UN 2360	101	1.75	Normal	B	Standard	
Dibenzyldichlorosilane	UN 2434	101	1.75	Normal	B	6.35 mm	
Dibromobenzene	UN 2711	102	1.0	Normal	A	Standard	
Dibromochloropropane	UN 2872	101	1.75	Normal	A	Standard	
Dibromodifluoromethane	UN 1941	101	2.67	Normal	A	Standard	
Dibutylaminoethanol	UN 2873	102	1.0	Normal	A	Standard	
Dibutyl ethers	UN 1149	102	1.0	Normal	A	Standard	
1,1-Dichloro-1-nitroethane	UN 2650	101	1.75	Normal	B	Standard	
Dichloroacetic acid	UN 1764	101	1.75	Normal	C	8 mm	
Dichloroacetyl chloride	UN 1765	101	1.75	Normal	B	6.35 mm	

IM TANK TABLE
January 1, 1981

(1) Hazardous Materials Descriptions [many of these descriptions are not proper shipping names. See 172.101 for proper shipping name]	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Dichloroanilines	UN 1590	101	2.67	Normal	B	Standard	
ortho-Dichlorobenzene	UN 1591	101	1.75	Normal	A	Standard	
Dichlorodimethyl ether, [symmetrical]	UN 2249	Not authorized for transportation in IM101 or IM102 tanks					
1,1-Dichloroethane	UN 2362	101	1.75	Normal	A	Standard	
Dichloroethylene	UN 1150	101	2.67	Normal	B	Standard	
Dichloroethyl ether	UN 1916	101	1.75	Normal	B	Standard	
Dichloroisopropyl ether	UN 2490	101	1.75	Normal	B	Standard	
Dichloromethane	UN 1593	101	2.67	Normal	A	Standard	
Dichloropentanes	UN 1152	102	1.0	Normal	A	Standard	
Dichlorophenyltrichlorosilane	UN 1766	101	1.75	Normal	B	6.35 mm	
Dichloropropene	UN 2047	101	1.75	Normal	B	Standard	
Dicyclohexylamine	UN 2565	101	1.75	Normal	B	Standard	
Dicyclopentadiene	UN 2048	101	1.75	Normal	B	Standard	
Diethoxymethane	UN 2373	101	1.75	Normal	B	Standard	
3,3-Diethoxypropene	UN 2374	102	1.0	Normal	A	Standard	
Diethyl aluminum chloride	UN 1101	Not authorized for transportation in IM101 or IM102 tanks					
Diethylamine	UN 1154	101	1.75	Normal	B	Standard	
Diethylaminoethanol	UN 2686	102	1.0	Normal	A	Standard	
Diethylaminopropylamine	UN 2684	101	1.75	Normal	B	Standard	
N,N-Diethylaniline	UN 2432	102	1.0	Normal	B	Standard	
Diethylbenzene	UN 2049	102	1.0	Normal	A	Standard	
Diethylcarbonate	UN 2366	102	1.0	Normal	A	Standard	
Diethyl dichlorosilane	UN 1767	101	1.75	Normal	B	6.35 mm	
N,N-Diethylenediamine	UN 2685	101	1.75	Normal	B	Standard	
Diethylenetriamine	UN 2079	101	1.75	Normal	B	Standard	
Diethyl ketone	UN 1156	102	1.0	Normal	A	Standard	
Diethyl magnesium	UN 1367	Not authorized for transportation in IM101 or IM102 tanks					
Diethyl sulfate	UN 1594	101	2.67	Normal	B	Standard	
Diethyl sulfide	UN 2375	101	2.67	Normal	B	Standard	
Diethyl thiophosphoryl chloride	UN 2751	101	1.75	Normal	B	Standard	
Diethyl zinc	UN 1366	Not authorized for transportation in IM101 or IM102 tanks					
Difluorophosphoric acid, anhydrous	UN 1768	101	1.75	Normal	Prohibited	8 mm	
2,3-Dihydropyran	UN 2376	101	1.75	Normal	A	Standard	
Diisobutylamine	UN 2361	101	1.75	Normal	B	Standard	
Diisobutylene, [isomeric compounds]	UN 2050	102	1.0	Normal	A	Standard	
Diisobutyl ketone	UN 1157	102	1.0	Normal	A	Standard	
Diisooctyl acid phosphate	UN 1902	101	1.75	Normal	A	Standard	
Diisopropylamine	UN 1158	101	1.75	Normal	B	Standard	
Diisopropylethanolamine	UN 2925	101	1.75	Normal	A	Standard	
Diisopropyl ether ([isopropyl ether])	UN 1159	101	1.75	Normal	B	Standard	
Diketene, [inhibited]	UN 2521	101	1.75	Normal	A	Standard	
1,1-Dimethoxyethane	UN 2377	102	1.0	Normal	A	Standard	
1,2-Dimethoxyethane	UN 2252	102	1.0	Normal	A	Standard	
Dimethylamine, aqueous solution ([not exceeding 40 percent by weight])	UN 1160	101	1.75	Normal	B	Standard	
2-Dimethylaminoacetonitrile	UN 2378	101	1.75	Normal	B	Standard	

IM TANK TABLE
January 1, 1981

For explanation of abbreviations and reference marks, see last page of this tariff.

(1) Hazardous Materials Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Dimethylaminoethyl methacrylate	UN 2522	101	1.75	Normal	B	Standard	
N,N Dimethylaniline	UN 2253	101	1.75	Normal	B	Standard	
2,3-Dimethyl butane	UN 2457	101	2.67	Normal	A	Standard	
1,3 Dimethylbutylamine	UN 2379	101	1.75	Normal	B	Standard	
Dimethyl carbamoyl chloride	UN 2262	101	1.75	Normal	B	Standard	
Dimethyl carbonate	UN 1161	101	1.75	Normal	B	Standard	
Dimethylcyclohexanes	UN 2263	102	1.0	Normal	A	Standard	
Dimethylcyclohexylamine	UN 2264	101	1.75	Normal	B	Standard	
Dimethyldichlorosilane	UN 1162	101	2.67	Normal	Prohibited	6.35 mm	
Dimethylethoxysilane	UN 2380	101	1.75	Normal	B	Standard	
Dimethyldioxanes	UN 2707	101	1.75	Normal	B	Standard	
Dimethyl disulfide	UN 2381	101	1.75	Normal	B	Standard	
Dimethylethanolamine	UN 2051	101	1.75	Normal	B	Standard	
N,N-Dimethylformamide	UN 2265	102	1.0	Normal	A	Standard	
Dimethyl hydrazine, [symmetrical]	UN 2382	101	2.67	Special	Prohibited	6.35 mm	
Dimethyl hydrazine, [unsymmetrical]	UN 1163	101	2.67	Special	Prohibited	Standard	
Dimethyl magnesium	UN 1368	Not authorized for transportation in IM101 or IM102 tanks					
Dimethyl-N-propylamine	UN 2266	101	2.67	Normal	B	6.35 mm	
Dimethyl sulfate	UN 1595	101	2.67	Special	Prohibited	6.35 mm	
Dimethyl sulfide	UN 1164	101	2.67	Normal	B	Standard	
Dimethyl thiophosphoryl chloride	UN 2267	101	1.75	Normal	A	Standard	
Dimethyl zinc	UN 1370	Not authorized for transportation in IM101 or IM102 tanks					
Di-(n-amyl)amine	UN 2841	101	1.75	Normal	B	Standard	
Di-(n-butyl)amine	UN 2248	101	1.75	Normal	B	Standard	
Dinitroanilines	UN 1596	101	2.67	Normal	B	Standard	
Dinitrobenzenes, solutions	UN 1597	101	2.67	Normal	B	Standard	
Dinitrochlorobenzene ([chlorodinitrobenzene, solution])	UN 1577	101	2.67	Normal	B	Standard	
Dinitro-o-cresol	UN 1598	101	2.67	Normal	B	Standard	
Dinitrophenol, solutions	UN 1599	101	1.75	Normal	B	Standard	
Dinitrotoluenes, [liquid]	UN 1600	101	2.67	Normal	B	Standard	
Dioxane	UN 1165	101	1.75	Normal	B	Standard	
Dioxolane	UN 1166	101	1.75	Normal	B	Standard	
Dipentene	UN 2052	102	1.0	Normal	A	Standard	
Diphenylamine-chloroarsine	UN 1698	Not authorized for transportation in IM101 or IM102 tanks					
Diphenylchloroarsine	UN 1699	Not authorized for transportation in IM101 or IM102 tanks					
Diphenyldichlorosilane	UN 1769	101	1.75	Normal	B	6.35 mm	
Diphenylmethane-4,4-diisocyanate	UN 2489	101	1.75	Normal	B	Standard	
Diphenylmethyl bromide solution	UN 1770	101	1.75	Normal	B	6.35 mm	
Diphosgene	Not authorized for transportation in IM101 or IM102 tanks						
Dipropylamine	UN 2383	101	1.75	Normal	B	Standard	
Dipropylene triamine	UN 2269	101	1.75	Normal	B	Standard	
Dipropyl ether	UN 2384	102	1.0	Normal	A	Standard	
Dipropyl ketone	UN 2710	102	1.0	Normal	A	Standard	
Divinyl ether, [inhibited]	UN 1167	101	2.67	Normal	B	Standard	
Dodecyltrichlorosilane	UN 1771	101	1.75	Normal	B	6.35 mm	

(1) Hazardous Material's Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Driers, paint or varnish							
(a) Flashpoint below 32 deg F	UN 1168	101	1.75	Normal	B	Standard	
(b) Flashpoint 32 deg F or above	UN 1168	102	1.0	Normal	B	Standard	
Electrolyte (acid [or] alkaline). [See] Battery fluid							
Epibromohydrin	UN 2558	101	2.67	Special	Prohibited	6.35 mm	
Epichlorohydrin	UN 2023	101	2.67	Normal	B	Standard	
1,2-Epoxy-3-ethoxy propane	UN 2752	102	1.0	Normal	A	Standard	
Eradicators, paint or grease, liquid							
(a) Flashpoint below 32 deg F	UN 1850	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1850	102	1.0	Normal	A	Standard	
Ethyl acetate	UN 1173	102	1.0	Normal	B	Standard	
Ethyl acrylate, [inhibited]	UN 1917	101	1.75	Normal	B	Standard	
Ethyl alcohol ([ethanol or ethanol solutions, including alcoholic beverages)]	UN 1170	102	1.0	Normal	A	Standard	
Ethyl aluminum dichloride	UN 1924	Not authorized for transportation in IM101 or IM102 tanks					
Ethyl aluminum sesquichloride	UN 1925	Not authorized for transportation in IM101 or IM102 tanks					
Ethylamine, solution, ([50 to 70 percent by weight])	UN 2270	101	2.67	Normal	B	Standard	
Ethyl amyl ketone	UN 2271	102	1.0	Normal	A	Standard	
N-Ethylaniline	UN 2272	102	1.0	Normal	B	Standard	
2-Ethylaniline	UN 2273	102	1.0	Normal	B	Standard	
Ethyl benzene	UN 1175	102	1.0	Normal	A	Standard	
N-Ethylbenzyltoluidines	UN 2753	101	2.67	Normal	B	Standard	
Ethyl borate	UN 1176	101	1.75	Normal	B	Standard	
Ethyl bromide	UN 1891	101	2.67	Special	B	Standard	
Ethyl bromoacetate	UN 1603	101	2.67	Normal	B	Standard	
2-Ethyl butanol	UN 2275	102	1.0	Normal	A	Standard	
Ethyl butyl acetate	UN 1177	102	1.0	Normal	A	Standard	
Ethyl butyl ether	UN 1179	102	1.0	Normal	A	Standard	
Ethyl butyraldehyde	UN 1178	102	1.0	Normal	A	Standard	
Ethyl butyrate	UN 1180	102	1.0	Normal	A	Standard	
Ethyl chloride	UN 1037	Not authorized for transportation in IM101 or IM102 tanks					
Ethyl chloroacetate	UN 1181	101	2.67	Normal	B	Standard	
Ethyl chloroformate	UN 1182	Not authorized for transportation in IM101 or IM102 tanks					
Ethyl chlorothioformate	UN 2826	101	2.67	Normal	B	Standard	
Ethyl crotonate	UN 1862	102	1.0	Normal	A	Standard	
Ethyl cyanoacetate	UN 2666	101	1.75	Normal	B	Standard	
Ethyldichloroarsine	UN 1892	Not authorized for transportation in IM101 or IM102 tanks					
Ethyldichlorosilane	UN 1183	101	2.67	Normal	Prohibited	6.35 mm	
Ethylene chlorohydrin	UN 1135	101	2.67	Special	Prohibited	Standard	
Ethylene diamine	UN 1604	101	2.67	Normal	B	Standard	
Ethylene dibromide	UN 1605	101	2.67	Normal	B	Standard	
Ethylene dichloride	UN 1184	101	2.67	Normal	B	Standard	
Ethylene glycol diethyl ether	UN 1153	102	1.0	Normal	A	Standard	
Ethylene glycol monobutyl ether	UN 2369	102	1.0	Normal	A	Standard	
Ethylene glycol monoethyl ether	UN 1171	102	1.0	Normal	A	Standard	

IM TANK TABLE
January 1, 1981

For explanation of abbreviations and reference marks, see last page of this tariff.

(1) Hazardous Material's Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Ethylene glycol monoethyl ether acetate	UN 1172	102	1.0	Normal	A	Standard	
Ethylene glycol monoethyl ether	UN 1188	102	1.0	Normal	A	Standard	
Ethylene glycol monomethyl ether acetate	UN 1189	102	1.0	Normal	A	Standard	
Ethyleneimine, [inhibited]	UN 1185	Not authorized for transportation in IM101 or IM102 tanks					
Ethylene oxide	UN 1040	Not authorized for transportation in IM101 or IM102 tanks					
Ethyl ether ([ether, or diethyl ether])	UN 1155	101	4.0	Normal	Prohibited	Standard	
Ethyl formate	UN 1190	101	1.75	Normal	B	Standard	
Ethyl hexaldehyde	UN 1191	102	1.0	Normal	A	Standard	
2-Ethylhexylamine	UN 2276	102	1.0	Normal	B	Standard	
2-Ethylhexylchloroformate	UN 2748	101	1.75	Special	Prohibited	Standard	
Ethyl isobutyrate	UN 2385	102	1.0	Normal	A	Standard	
Ethyl isocyanate	UN 2481	101	2.67	Special	Prohibited	6.35 mm	
Ethyl lactate	UN 1192	102	1.0	Normal	A	Standard	
Ethylene glycol monoethyl ether acetate	UN 1172	102	1.0	Normal	A	Standard	
Ethylene glycol monomethyl ether	UN 1188	102	1.0	Normal	A	Standard	
Ethylene glycol monomethyl ether acetate	UN 1189	102	1.0	Normal	A	Standard	
Ethyleneimine, [inhibited]	UN 1185	Not authorized for transportation in IM101 or IM102 tanks					
Ethylene oxide	UN 1040	Not authorized for transportation in IM101 or IM102 tanks					
Ethyl ether ([ether, or diethyl ether])	UN 1155	101	4.0	Normal	Prohibited	Standard	
Ethyl formate	UN 1190	101	1.75	Normal	B	Standard	
Ethyl hexaldehyde	UN 1191	102	1.0	Normal	A	Standard	
2-Ethylhexylamine	UN 2276	102	1.0	Normal	B	Standard	
2-Ethylhexylchloroformate	UN 2748	101	1.75	Special	Prohibited	Standard	
Ethyl isobutyrate	UN 2385	102	1.0	Normal	A	Standard	
Ethyl isocyanate	UN 2481	101	2.67	Special	Prohibited	6.35 mm	
Ethyl lactate	UN 1192	102	1.0	Normal	A	Standard	
Ethyl mercaptan	UN 2363	101	4.0	Normal	Prohibited	Standard	
Ethyl methacrylate	UN 2277	102	1.0	Normal	A	Standard	
Ethyl methyl ether	UN 1039	Not authorized for transportation in IM101 or IM102 tanks					
Ethyl methyl ketone [or] Methyl ethyl ketone	UN 1193	101	1.75	Normal	B	Standard	
N-Ethyl-N-benzylaniline	UN 2274	102	1.0	Normal	B	Standard	
Ethyl nitrite ([including solutions])	UN 1194	Not authorized for transportation in IM101 or IM102 tanks					
Ethyl orthoformate	UN 2524	101	1.75	Normal	A	Standard	
Ethyl oxalate	UN 2525	102	1.0	Normal	A	Standard	
Ethyl phenyl dichlorosilane	UN 2435	101	1.75	Normal	B	6.35 mm	
Ethyl propionate	UN 1195	102	1.0	Normal	A	Standard	
Ethyl propyl ether	UN 2615	101	1.75	Normal	B	Standard	
Ethyl silicate ([tetraethyl silicate])	UN 1292	102	1.0	Normal	A	Standard	
Ethylsulfuric acid	UN 2571	101	1.75	Normal	Prohibited	8 mm	
N-Ethyltoluidines	UN 2754	101	2.67	Normal	B	Standard	
Ethyltrichlorosilane	UN 1196	101	2.67	Normal	Prohibited	6.35 mm	
Extracts, aromatic, liquid							
(a) Flashpoint below 32 deg F	UN 1169	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1169	102	1.0	Normal	A	Standard	
Extracts, flavoring, liquid							
(a) Flashpoint below 32 deg F	UN 1197	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1197	102	1.0	Normal	A	Standard	
Ferric chloride solution	UN 2582	101	1.75	Normal	B	Standard	

(1) Hazardous Material's Descriptions [many of these descriptions are not proper shipping names. See 172.101 for proper shipping name]	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Flammable liquid, not listed by name in this table ([vapor pressure not greater than 43 psia at 122 deg F and no subsidiary hazards]):							
(a) Boiling point 95 deg F or lower	Various	Must be specifically authorized prior to transportation. See 49CFR173.32c(d)					
(b) Boiling point above 95 deg F, vapor pressure not greater than 33.7 psi at 150 deg F	Various	101	2.67	Normal	B	Standard	
(c) Boiling point above 95 deg F, vapor pressure not greater than 20.4 psi at 150 deg F	Various	101	1.75	Normal	A	Standard	
(d) Boiling point above above 95 deg F, vapor pressure not greater than 9.5 psi at 150 deg F, flashpoint 32 deg F or above	Various	102	1.0	Normal	A	Standard	
Flammable liquid, not listed by name in this table ([vapor pressure not greater than 43 psia at 122 deg F, subsidiary Class B poison hazard]):							
(a) Boiling point 95 deg F or lower, oral LD50 of 5 mg/kg or lower, dermal LD50 of 40 mg/kg or lower or LC50 of 2 mg/l or lower	Various	Must be specifically authorized prior to transportation. See 49CFR173.32c(d)					
(b) Vapor pressure not greater than 33.7 psi at 150 deg F	Various	101	2.67	Special	Prohibited	Standard	
Flammable liquid, not listed by name in this table ([vapor pressure not greater than 43 psia at 122 deg F, with subsidiary corrosive hazard]):							
(a) Boiling point 95 deg F or lower	Various	Must be specifically authorized prior to transportation. See 49CFR173.32c(d)					
(b) Boiling point 95 deg F or above, and vapor pressure not greater than 33.7 psia at 150 deg F	Various	101	2.67	Special	Prohibited	Standard	
Fluoboric acid	UN 1775	101	2.67	Normal	Prohibited	6 mm	
Fluorbenzene	UN 2387	101	1.75	Normal	B	Standard	
Fluorophosphoric acid, anhydrous [See] Monofluorophosphoric acid							
Fluorosilicic acid	UN 1778	101	1.75	Normal	Prohibited	6 mm	
Fluorosulfonic acid [or] Fluorosulphonic acid	UN 1777	101	1.75	Special	Prohibited	6 mm	
Fluortoluenes	UN 2388	101	1.75	Normal	B	Standard	
Formaldehyde, solution							
(a) Flashpoint not greater than 141 deg F	UN 1198	101	1.75	Normal	B	Standard	
(b) Flashpoint greater than 141 deg F	UN 2209	102	1.0	Normal	A	Standard	
Formic acid	UN 1779	101	1.75	Normal	B	Standard	
Fuel, aviation, turbine engine							
(a) Flashpoint below 32 deg F	UN 1863	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 F or above	UN 1863	102	1.0	Normal	A	Standard	
Fuel oil [See] Gas oil							
Fuel, pyrophoric, not listed by name in this table	Various	Not authorized for transportation in IM101 or IM102 tanks					
Fumaryl chloride	UN 1780	101	1.75	Normal	B	6.35 mm	
Furan	UN 2389	101	2.67	Special	Prohibited	Standard	
Furfural	UN 1199	101	1.75	Normal	B	Standard	
Furfuryl alcohol	UN 2874	102	1.0	Normal	B	Standard	
Furfurylamine	UN 2526	101	1.75	Normal	B	Standard	
Fusel oil	UN 1201	102	1.0	Normal	A	Standard	
Gas drips, hydrocarbon							
(a) Flashpoint below 32 deg F	UN 1864	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1864	102	1.0	Normal	A	Standard	
Gasohol ([gasoline mixed with ethyl alcohol]) [See] Gasoline							
Gas oil							
(a) Flashpoint below 32 deg F	UN 1202	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1202	102	1.0	Normal	A	Standard	
Gasoline ([including casinghead and natural])	UN 1203	101	1.75	Normal	B	Standard	
Glycerol alpha-monochlorohydrin	UN 2689	102	1.0	Normal	B	Standard	
Glycidaldehyde	UN 2622	101	1.75	Normal	B	Standard	
Gutta percha solution							
(a) Flashpoint below 32 deg F	UN 1205	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1205	102	1.0	Normal	A	Standard	
Heptanes	UN 1206	102	1.0	Normal	B	Standard	
Heptene	UN 2278	101	1.75	Normal	B	Standard	
Hexachloroacetone	UN 2661	101	1.75	Normal	B	Standard	

IM TANK TABLE
January 1, 1981

For explanation of abbreviations and reference marks, see last page of this tariff.

(1) Hazardous Material's Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Hexachlorobutadiene	UN 2279	101	1.75	Normal	A	Standard	
Hexachlorocyclopentadiene	UN 2646	101	2.67	Special	Prohibited	6.35 mm	
Hexadecyltrichlorosilane	UN 1781	101	1.75	Normal	B	Standard	
Hexadiene	UN 2458	101	1.75	Normal	A	Standard	
Hexaethyl tetraphosphate, liquid	UN 1611	Not authorized for transportation in IM101 or IM102 tanks					
Hexaethyl tetraphosphate mixtures. [See] Poisonous liquid							
Hexafluoroacetone hydrate	UN 2552	101	2.67	Normal	B	Standard	
Hexafluorophosphoric acid	UN 1782	101	1.75	Normal	Prohibited	8 mm	
Hexaldehyde	UN 1207	102	1.0	Normal	A	Standard	
Hexamethylenediamine, solution	UN 1783	101	1.75	Normal	B	Standard	
Hexamethyleneimine	UN 2493	101	1.75	Normal	B	Standard	
Hexanes	UN 1208	101	1.75	Normal	B	Standard	
Hexanols	UN 2282	102	1.0	Normal	A	Standard	
1-Hexene	UN 2370	101	1.75	Normal	B	Standard	
Hexyltrichlorosilane	UN 1784	101	1.75	Normal	B	6.35 mm	
Hydrazine, anhydrous [or] hydrazine aqueous solutions [with more than 64 percent hydrazine by weight]	UN 2029	Not authorized for transportation in IM101 or IM102 tanks					
Hydrazine hydrate, [or] hydrazine aqueous solutions [with not more than 64 percent hydrazine by weight]	UN 2030	101	2.67	Normal	Prohibited	Standard	
Hydriodic acid	UN 1787	101	1.75	Normal	Prohibited	8 mm	
Hydrobromic acid	UN 1788	101	1.75	Normal	Prohibited	8 mm	
Hydrochloric acid mixtures. [See] Hydrochloric acid							
Hydrochloric acid [up to and including 36%]	UN 1789	101	1.75	Normal	Prohibited	8 mm	
Hydrocyanic acid, aqueous solution	UN 1613	Not authorized for transportation in IM101 or IM102 tanks					
Hydrofluoric acid, solution [less than 60 percent by weight]	UN 1790	101	2.67	Special	Prohibited	8 mm	
Hydrofluoric and sulfuric acid mixtures [acid mixtures, hydrofluoric and sulfuric]	UN 1786	101	2.67	Special	Prohibited	8 mm	
Hydrofluosilicic acid. [See] Fluosilicic acid							
Hydrogen peroxide solution:							
(a) Not more than 60 percent by weight in water	UN 2014	101	2.67	Normal	B	Standard	
(b) Over 60 percent by weight in water	UN 2015	Not authorized for transportation in IM101 or IM102 tanks					
Hydroquinone	UN 2662	101	1.75	Normal	B	Standard	
Hypochlorite solutions [with more than 7 percent available chlorine]	UN 1791	101	1.75	Normal	A	Standard	
Ink, [printers]							
(a) Flashpoint below 32 deg F	UN 1210	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1210	102	1.0	Normal	A	Standard	
Iodine monochloride	UN 1792	101	1.75	Normal	B	6.35 mm	
Iodine pentafluoride	UN 2495	Not authorized for transportation in IM101 or IM102 tanks					
2-Iodobutane	UN 2390	101	1.75	Normal	B	Standard	
Iodo-methylpropanes	UN 2391	101	1.75	Normal	B	Standard	
Iodopropanes	UN 2392	101	1.75	Normal	B	Standard	
Iron pentacarbonyl	UN 1994	Not authorized for transportation in IM101 or IM102 tanks					
Isobutanol	UN 1212	102	1.0	Normal	A	Standard	
Isobutyl acetate	UN 1213	102	1.0	Normal	A	Standard	
Isobutylamine	UN 1214	101	1.75	Normal	B	Standard	
Isobutyl formate	UN 2393	102	1.0	Normal	A	Standard	
Isobutyl isobutyrate	UN 2528	102	1.0	Normal	A	Standard	

IM TANK TABLE
January 1, 1981

(1) Hazardous Materials Descriptions (many of these descriptions are not proper shipping names. See 173.181 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Isobutyl isocyanate	UN 2486	101	1.75	Normal	Prohibited	Standard	
Isobutyl methacrylate	UN 2283	102	1.0	Normal	A	Standard	
Isobutyl propionate	UN 2394	101	1.75	Normal	A	Standard	
Isobutyraldehyde	UN 2045	101	1.75	Normal	B	Standard	
Isobutyric acid	UN 2529	102	1.0	Normal	A	Standard	
Isobutyric anhydride	UN 2530	102	1.0	Normal	A	Standard	
Isobutyronitrile	UN 2284	101	2.67	Special	B	Standard	
Isobutyryl chloride	UN 2395	101	1.75	Normal	C	6.35 mm	
Isododecane. [See] Pentamethylheptane							
Isoheptane	UN 2287	101	1.75	Normal	A	Standard	
Isohexane	UN 2288	101	1.75	Normal	A	Standard	
Isooctane. [See] octane and its isomers							
Isooctene	UN 1216	101	1.75	Normal	B	Standard	
Isopentane	UN 1265	101	4.0	Normal	B	Standard	
Isopentenes	UN 2371	101	4.0	Normal	B	Standard	
Isophoronediamine	UN 2289	101	1.75	Normal	B	Standard	
Isophoronediisocyanate	UN 2290	101	1.75	Normal	B	Standard	
Isoprene, [inhibited]	UN 1218	101	4.0	Normal	B	Standard	
Isopropanol	UN 1219	102	1.0	Normal	A	Standard	
Isopropenyl acetate	UN 2403	102	1.0	Normal	A	Standard	
Isopropenyl benzene	UN 2303	102	1.0	Normal	A	Standard	
Isopropyl acetate	UN 1220	102	1.0	Normal	A	Standard	
Isopropyl acid phosphate	UN 1793	101	1.75	Normal	A	Standard	
Isopropylamine	UN 1221	101	4.0	Normal	B	Standard	
Isopropylbenzene	UN 1918	102	1.0	Normal	A	Standard	
Isopropyl butyrate	UN 2405	102	1.0	Normal	A	Standard	
Isopropyl chloroformate	UN 2407	Not authorized for transportation in IM101 or IM102 tanks					
Isopropyl formate	UN 2406	101	1.75	Normal	B	Standard	
Isopropyl isobutyrate	UN 2406	102	1.0	Normal	A	Standard	
Isopropyl isocyanate	UN 2483	101	2.67	Special	Prohibited	6.35 mm	
Isopropyl mercaptan	UN 2703	101	2.67	Normal	Prohibited	Standard	
Isopropyl nitrate	UN 1222	Not authorized for transportation in IM101 or IM102 tanks					
Isopropyl propionate	UN 2409	102	1.0	Normal	A	Standard	
Kerosene	UN 1223	102	1.0	Normal	A	Standard	
Ketones, liquid, not listed by name in this table							
(a) Flashpoint below 32 deg F	Various	101	1.75	Normal	B	Standard	
(b) Flashpoint 32 deg F or above	Various	102	1.0	Normal	B	Standard	
Lead perchlorate, solution	UN 1470	101	1.75	Normal	B	Standard	
Lithium alkyls	UN 2445	Not authorized for transportation in IM101 or IM102 tanks					
Lithium aluminum hydride, ethereal	UN 1411	Not authorized for transportation in IM101 or IM102 tanks					
Lithium hydroxide, solution	UN 2679	101	1.75	Normal	B	Standard	
Magnesium perchlorate, solution	UN 1475	101	1.75	Normal	B	Standard	
Maleic anhydride (molten)	UN 2215	101	1.75	Normal	A	Standard	
Mercaptans, liquid, [or] Mercaptan mixtures, liquid ([aliphatic]), not listed by name in this table	Varies	101	2.67	Normal	Prohibited	Standard	
Mesityl oxide	UN 1229	101	1.75	Normal	B	Standard	

IM TANK TABLE
January 1, 1981

For explanation of abbreviations and reference marks, see last page of this tariff.

(1) Hazardous Materials Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Metal alkyls, not listed by name in this table	Various	Not authorized for transportation in IM101 or IM102 tanks					
Methacrylaldehyde	UN 2396	101	1.75	Normal	B	Standard	
Methacrylic acid, [inhibited]	UN 2531	101	1.75	Normal	B	Standard	
Methallyl alcohol	UN 2614	101	1.75	Normal	B	Standard	
4 Methoxy 4 methylpentan-2-one	UN 2293	102	1.0	Normal	A	Standard	
Methoxymethyl isocyanate	UN 2605	101	2.67	Special	Prohibited	6.35 mm	
2 Methyl 1-butene	UN 2459	101	2.67	Normal	B	Standard	
3 Methyl 1-butene	UN 2561	101	4.0	Normal	B	Standard	
2 Methyl 2-butene	UN 2460	101	2.67	Normal	B	Standard	
Methyl acetate	UN 1231	101	1.75	Normal	B	Standard	
Methyl acetone	UN 1232	101	1.75	Normal	B	Standard	
Methyl acrylate, inhibited	UN 1919	101	1.75	Normal	B	Standard	
Methylal	UN 1234	101	2.67	Normal	B	Standard	
Methyl alcohol ([methanol])	UN 1230	101	1.75	Normal	B	Standard	
Methyl allyl chloride	UN 2554	101	1.75	Normal	B	Standard	
Methyl aluminum sesquibromide	UN 1926	Not authorized for transportation in IM101 or IM102 tanks					
Methyl aluminum sesquichloride	UN 1927	Not authorized for transportation in IM101 or IM102 tanks					
Methylamine, aqueous solution	UN 1235	101	1.75	Normal	B	Standard	
Methyl amyl acetate	UN 1233	102	1.0	Normal	A	Standard	
Methyl amyl ketone ([amyl methyl ketone])	UN 1110	102	1.0	Normal	A	Standard	
N Methylaniline	UN 2294	101	1.75	Normal	A	Standard	
Methyl bromide	UN 1062	Not authorized for transportation in IM101 or IM102 tanks					
Methyl bromide and ethylene dibromide mixtures, liquid	UN 1647	Not authorized for transportation in IM101 or IM102 tanks					
Methyl bromoacetate	UN 2643	101	1.75	Normal	B	Standard	
3 Methyl butan-2-one	UN 2397	102	1.0	Normal	A	Standard	
Methyl butyrate	UN 1237	102	1.0	Normal	A	Standard	
Methyl chloroacetate	UN 2295	101	1.75	Special	B	Standard	
Methyl chloroformate	UN 1238	Not authorized for transportation in IM101 or IM102 tanks					
Methyl chloromethyl ether, anhydrous ([methyl chloromethyl ether])	UN 1239	101	1.75	Normal	B	Standard	
Methyl chlorosilane	UN 2534	101	2.67	Special	Prohibited	6.35 mm	
Methyl cyclohexane	UN 2296	102	1.0	Normal	A	Standard	
Methylcyclohexanols	UN 2617	102	1.0	Normal	B	Standard	
Methyl cyclohexanone	UN 2297	102	1.0	Normal	A	Standard	
Methyl cyclopentane	UN 2298	101	1.75	Normal	B	Standard	
Methyl dichloroacetate	UN 2299	102	1.0	Normal	A	Standard	
Methyl dichlorosilane	UN 1242	101	2.67	Normal	B	6.35 mm	
Methyl ethyl pyridine	UN 2300	101	1.75	Normal	A	Standard	
Methyl formate	UN 1243	101	4.0	Normal	B	Standard	
Methylfuran	UN 2301	101	1.75	Normal	A	Standard	
5 Methylhexan-2-one	UN 2302	102	1.0	Normal	A	Standard	
Methylhydrazine	UN 1244	101	2.67	Special	Prohibited	6.35 mm	
Methyl iodide	UN 2644	101	2.67	Normal	B	Standard	
Methylisobutyl carbinol	UN 2053	102	1.0	Normal	A	Standard	
Methyl isobutyl ketone	UN 1245	102	1.0	Normal	A	Standard	
Methyl isocyanate [or] Methyl isocyanate solutions	UN 2480	101	4.0	Special	Prohibited	6.35 mm	

IM TANK TABLE
January 1, 1981

(1) Hazardous Material's Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Methyl isopropenyl ketone, [inhibited]	UN 1246	101	1.75	Normal	A	Standard	
Methyl isothiocyanate	UN 2477	101	2.67	Normal	Prohibited	Standard	
Methyl isovalerate	UN 2400	102	1.0	Normal	A	Standard	
Methyl magnesium bromide in ethyl ether	UN 1928	Not authorized for transportation in IM101 or IM102 tanks					
Methyl methacrylate monomer, inhibited	UN 1247	101	1.75	Normal	B	Standard	
Methyl morpholine	UN 2535	101	1.75	Normal	B	Standard	
Methyl orthosilicate	UN 2606	101	2.67	Special	Prohibited	6.35 mm	
Methyl parathion mixtures [See] Poisonous liquid							
Methylpentadiene	UN 2461	101	1.75	Normal	A	Standard	
2 Methylpentan-2-ol	UN 2560	101	1.75	Normal	A	Standard	
Methylpentanes	UN 2462	101	1.75	Normal	A	Standard	
Methylphenyldichlorosilane	UN 2437	101	1.75	Normal	B	6.35 mm	
1 Methylpiperidine	UN 2399	101	1.75	Normal	B	Standard	
Methyl propionate	UN 1248	102	1.0	Normal	B	Standard	
Methyl propyl ether	UN 2612	101	2.67	Normal	B	Standard	
Methyl propyl ketone	UN 1249	102	1.0	Normal	A	Standard	
Methyl tert butyl ether	UN 2398	101	1.75	Normal	A	Standard	
Methyltetrahydrofuran	UN 2536	101	1.75	Normal	A	Standard	
Methyltrichloroacetate	UN 2533	102	1.0	Normal	A	Standard	
Methyltrichlorosilane	UN 1250	101	2.67	Normal	B	6.35 mm	
alpha Methyl valeraldehyde	UN 2367	102	1.0	Normal	A	Standard	
Methyl vinyl ketone	UN 1251	101	1.75	Normal	B	Standard	
Mixtures of chlorosulphonic acid—sulfur trioxide		101	4.0	Special	Prohibited	6.35 mm	
Molybdenum pentachloride	UN 2508	101	1.75	Normal	B	6.35 mm	
Monoethanol amine [ethanol amine or ethanolamine solution]	UN 2491	101	1.75	Normal	A	Standard	
Monoethylamine [ethylamine]	UN 1036	Not authorized for transportation in IM101 or IM102 tanks					
Monofluorophosphoric acid, anhydrous [fluorophosphoric acid, anhydrous]	UN 1776	101	1.75	Normal	Prohibited	8 mm	
Morpholine	UN 2054	101	1.75	Normal	B	Standard	
Motor fuel antiknock compound	UN 1649	Not authorized for transportation in IM101 or IM102 tanks					
Motor spirit [See] Gasoline							
Naphthalene, molten	UN 2304	101	1.75	Normal	B	Standard	
Naphthas							
(a) Flashpoint below 32 deg F	Various	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	Various	102	1.0	Normal	A	Standard	
Naphthylamine (alpha)	UN 2077	101	1.75	Normal	A	Standard	
Naphthylamine (beta), liquid	UN 1650	101	1.75	Special	Prohibited	6.35 mm	
Neohexane [See] Hexane							
Nickel carbonyl	UN 1259	Not authorized for transportation in IM101 or IM102 tanks					
Nicotine sulfate solution	UN 1658	101	2.67	Normal	B	Standard	
Nitrating acid [acid mixtures, nitrating acid]	UN 1796	101	1.75	Special	Prohibited	8 mm	
Nitrating acid, spent [acid mixtures, nitrating acid, spent]							
(a) More than 40 percent nitric acid	UN 1826	101	4.0	Special	Prohibited	Standard	
(b) Not more than 40 percent nitric acid	UN 1826	101	2.67	Normal	B	Standard	
Nitric acid, fuming	UN 2032	101	2.67	Special	Prohibited	8 mm	
Nitric acid [other than fuming]	UN 2031	101	1.75	Normal	Prohibited	8 mm	

(1) Hazardous Materials Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
3-Nitro-4-chlorobenzotrifluoride	UN 2307	101	1.75	Normal	B	Standard	
Nitroanilines	UN 1661	101	2.67	Normal	B	Standard	
Nitroanisoles	UN 2730	101	1.75	Normal	B	Standard	
Nitrobenzene [(nitrobenzol)]	UN 1662	101	2.67	Normal	B	Standard	
Nitrobenzotrifluorides	UN 2306	101	1.75	Normal	B	Standard	
Nitrobromobenzene	UN 2732	101	1.75	Normal	B	Standard	
Nitrocellulose, containing not more than 12.6 percent nitrogen, solutions in flammable liquids not exceeding 55 percent nitrocellulose by weight							
(a) Flashpoint of solution below 73 deg F	UN 2059	101	1.75	Normal	Prohibited	Standard	
(b) Flashpoint of solution 73 deg F or above	UN 2060	101	1.75	Normal	Prohibited	Standard	
Nitroethane	UN 2842	101	1.75	Normal	B	Standard	
Nitrohydrochloric acid	UN 1798	101	2.67	Special	Prohibited	8 mm	
Nitromethane	UN 1261	Not authorized for transportation in IM101 or IM102 tanks					
Nitropropanes	UN 2608	102	1.0	Normal	A	Standard	
Nitrosylsulphuric acid	UN 2308	101	1.75	Normal	Prohibited	8 mm	
Nitrotoluenes	UN 1664	101	2.67	Normal	B	Standard	
Nitroxylenes [(nitroxylols)]	UN 1665	101	2.67	Normal	B	Standard	
Nonanes	UN 1920	102	1.0	Normal	A	Standard	
Nonyltrichlorosilane	UN 1799	101	1.75	Normal	B	6.35 mm	
Di-normal-amylamine	UN 2841	101	1.75	Normal	B	Standard	
Octadecyltrichlorosilane	UN 1800	101	1.75	Normal	B	Standard	
Octadiene	UN 2309	102	1.0	Normal	A	Standard	
Octanes	UN 1262	102	1.0	Normal	A	Standard	
Octyltrichlorosilane	UN 1801	101	1.75	Normal	B	6.35 mm	
Oleum. [See] Sulfuric acid, fuming							
Organic phosphate mixtures [or] Organic phosphorus compound mixtures. [See] Poisonous liquid							
Organic phosphate [or] Organic phosphorus compound. [See] Poisonous liquid							
Paints, enamels, lacquers, stains, shellac, varnish, polishes, fillers [(liquid)], lacquer base, thinners, etc.							
(a) Flashpoint below 32 deg F	UN 1263	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1263	102	1.0	Normal	A	Standard	
Paraldehyde	UN 1264	102	1.0	Normal	A	Standard	
Parathion	Not authorized for transportation in IM101 or IM102 tanks						
Parathion mixtures. [See] Poisonous liquid							
Pentaborane	UN 1380	Not authorized for transportation in IM101 or IM102 tanks					
Pentachloroethane	UN 1669	101	2.67	Normal	B	Standard	
Pentamethylheptane	UN 2286	102	1.0	Normal	A	Standard	
Pentan-2,4-dione	UN 2310	102	1.0	Normal	A	Standard	
Pentane	UN 1265	101	4.0	Normal	B	Standard	
3-Pentanol	UN 2706	101	1.75	Normal	B	Standard	
1-Pentol	UN 2705	101	1.75	Normal	B	Standard	
Perchloric acid, not exceeding 50 percent acid by weight	UN 1802	101	1.75	Normal	Prohibited	Standard	
Perchloric acid [(over 50 percent by weight)]	UN 1873	Not authorized for transportation in IM101 or IM102 tanks					
Perchloromethyl mercaptan	UN 1670	101	2.67	Special	Prohibited	6.35 mm	

IM TANK TABLE
January 1, 1981

(1) Hazardous Materials Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Perfumery products, flammable							
(a) Flashpoint below 32 deg F	UN 1266	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1266	102	1.0	Normal	A	Standard	
Petroleum crude oil							
(a) Flashpoint below 32 deg F	UN 1267	101	1.75	Normal	B	Standard	
(b) Flashpoint 32 deg F or above	UN 1267	102	1.0	Normal	B	Standard	
Petroleum distillate:							
(a) Flashpoint below 32 deg F	UN 1268	101	1.75	Normal	B	Standard	
(b) Flashpoint 32 deg F or above	UN 1268	102	1.0	Normal	B	Standard	
Petroleum ether. [See] Petroleum spirit							
Petroleum oil							
(a) Flashpoint below 32 deg F	UN 1270	101	1.75	Normal	B	Standard	
(b) Flashpoint 32 deg F or above	UN 1270	102	1.0	Normal	B	Standard	
Petroleum spirit	UN 1271	101	1.75	Normal	B	Standard	
Phenetidines (ortho-, para-)	UN 2311	101	1.75	Normal	A	Standard	
Phenols, molten, liquid	UN 2312	101	1.75	Normal	B	Standard	
Phenol, solution	UN 2821	101	2.67	Normal	B	Standard	
Phenolsulfonic acid, liquid	UN 1803	101	1.75	Normal	B	Standard	
Phenylacetyl chloride	UN 2577	101	1.75	Normal	B	6.35 mm	
Phenylcarbylamine chloride	UN 1672	101	2.67	Special	Prohibited	6.35 mm	
Phenyl chloroformate	UN 2746	101	1.75	Special	Prohibited	Standard	
Phenyldichloroarsine	—	Not authorized for transportation in IM101 or IM102 tanks					
Phenylhydrazine	UN 2572	101	1.75	Normal	B	Standard	
Phenyl isocyanate	UN 2487	101	1.75	Normal	B	Standard	
Phenyl mercaptan	UN 2337	101	2.67	Special	Prohibited	6.35 mm	
Phenyltrichlorosilane	UN 1804	101	1.75	Normal	B	6.35 mm	
Phosgene	UN 1076	Not authorized for transportation in IM101 or IM102 tanks					
Phosphoric acid	UN 1805	101	1.75	Normal	A	Standard	
Phosphoric acid, anhydrous	UN 1807	Not authorized for transportation in IM101 or IM102 tanks					
Phosphorous oxybromide	UN 1939	101	1.75	Normal	B	6.35 mm	
Phosphorus, oxybromide, molten	UN 2576	101	1.75	Normal	B	8 mm	
Phosphorus oxychloride	UN 1810	101	1.75	Normal	B	6.35 mm	
Phosphorus, tribromide	UN 1808	101	1.75	Normal	B	6.35 mm	
Phosphorus, trichloride	UN 1809	101	1.75	Special	B	6.35 mm	
Phthalic anhydride (molten)	UN 2214	101	1.75	Normal	A	Standard	
Picolines	UN 2313	101	1.75	Normal	B	Standard	
alpha-Pinene	UN 2368	102	1.0	Normal	A	Standard	
Pine oil	UN 1272	102	1.0	Normal	A	Standard	
Piperidine	UN 2401	102	1.0	Normal	B	Standard	
Pivaloyl chloride. [See] Trimethyl acetyl chloride							
Poisonous liquid [(other than Class A poison)], not listed by name in this table ([vapor pressure not exceeding 43 psia at 122 deg F and no subsidiary hazard]):							
(a) Oral LD50 of 4 mg/kg or lower, dermal LD50 of 40 mg/kg or lower or LC50 of 2 mg/l or lower	Various	Must be specifically authorized prior to transportation. See 49CFR173.32c(d)					
(b) Oral LD50 greater than 5 mg/kg and dermal LD50 greater than 40 mg/kg	Various	101	2.67	Normal	B	Standard	

IM TANK TABLE
January 1, 1981

For explanation of abbreviations and reference marks, see last page of this tariff.

(1) Hazardous Materials Descriptions [many of these descriptions are not proper shipping names. See 172.101 for proper shipping name]	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Potassium chlorate, solution	UN 2427	101	1.75	Normal	B	Standard	
Potassium cyanide solution	UN 1680	101	2.67	Special	Prohibited	6.35 mm	
Potassium fluoride solution	UN 1812	101	1.75	Normal	B	Standard	
Potassium hydrogen fluoride solution	UN 1811	101	1.75	Normal	B	Standard	
Potassium hydroxide, solution	UN 1814	101	1.75	Normal	B	Standard	
Potassium perchlorate, solution	UN 1489	101	1.75	Normal	B	Standard	
Propanethiols	UN 2402	101	1.75	Normal	B	Standard	
Propionaldehyde	UN 1275	101	2.67	Normal	B	Standard	
Propionic acid	UN 1848	101	1.75	Normal	A	Standard	
Propionic anhydride	UN 2496	102	1.0	Normal	B	Standard	
Propionitrile	UN 2404	101	2.67	Normal	B	Standard	
Propionyl chloride	UN 1815	101	1.75	Normal	B	6.35 mm	
Propyl acetate, normal	UN 1276	102	1.0	Normal	A	Standard	
Propyl alcohol (propanol)	UN 1274	102	1.0	Normal	A	Standard	
Propylamine	UN 1277	101	2.67	Normal	B	Standard	
Propyl benzene	UN 2364	102	1.0	Normal	A	Standard	
Propyl chloride	UN 1278	101	2.67	Normal	B	Standard	
n-Propyl chloroformate	UN 2740	Not authorized for transportation in IM101 or IM102 tanks					
Propylene chlorohydrin	UN 2611	101	1.75	Normal	Prohibited	Standard	
Propylene diamine	UN 2258	101	1.75	Normal	B	Standard	
Propylene dichloride	UN 1279	102	1.0	Normal	A	Standard	
Propylene imine, [inhibited]	UN 1921	Not authorized for transportation in IM101 or IM102 tanks					
Propylene oxide	UN 1280	101	4.0	Normal	B	Standard	a
Propylene tetramer	UN 2850	102	1.0	Normal	A	Standard	
Propyl formates	UN 1281	101	1.75	Normal	B	Standard	
n-Propyl isocyanate	UN 2482	101	2.67	Special	Prohibited	6.35 mm	
Propyl mercaptan	UN 2704	101	2.67	Normal	Prohibited	Standard	
Propyl nitrate	UN 1865	Not authorized for transportation in IM101 or IM102 tanks					
Propyltrichlorosilane	UN 1816	101	1.75	Normal	B	6.35 mm	a
Pyridine	UN 1282	101	1.75	Normal	B	Standard	
Pyrophoric liquids not listed by name in this table	Various	Not authorized for transportation in IM101 or IM102 tanks					
Pyrosulfuryl chloride	UN 1817	101	1.75	Normal	Prohibited	8 mm	
Pyroxylin solution, [See] Nitrocellulose, containing not more than 12.6 percent nitrogen, solutions in flammable liquids not exceeding 55 percent nitro cellulose by weight							
Pyrrolidine	UN 1922	102	1.0	Normal	A	Standard	
Quinoline	UN 2656	101	1.75	Normal	B	Standard	
Resin oil	UN 1256	102	1.0	Normal	A	Standard	
Resin solution ([in flammable liquid]):							
(a) Flashpoint below 32 deg F	UN 1866	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above but not more than 90 deg F	UN 1866	102	1.0	Normal	A	Standard	
(c) Flashpoint 90 deg F or above	UN 2668	102	1.0	Normal	A	Standard	
Road asphalt, [or] tar, [See] Tars, liquid							
Rubber solution							
(a) Flashpoint below 32 deg F	UN 1287	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1287	102	1.0	Normal	A	Standard	

(1) Hazardous Material's Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Rubidium hydroxide, solutions	UN 2677	101	1.75	Normal	B	Standard	
Selenium oxychloride	UN 2879	101	1.75	Special	Prohibited	8 mm	
Shale oil							
(a) Flashpoint below 32 deg F	UN 1288	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1288	102	1.0	Normal	A	Standard	
Silicon tetrachloride [or] Silicon chloride	UN 1818	101	2.67	Special	Prohibited	6.35 mm	8
Sludge acid [See] Acid, sludge							
Sodium aluminate, solution	UN 1819	101	1.75	Normal	B	Standard	
Sodium arsenite, aqueous solution	UN 1686	101	2.67	Normal	Prohibited	Standard	
Sodium chlorate, solution	UN 2428	101	1.75	Normal	B	Standard	
Sodium chlorite, solution	UN 1496	101	1.75	Normal	B	Standard	
Sodium chlorite solution ([not exceeding 42 per cent sodium chlorite])	UN 1908	101	1.75	Normal	B	Standard	
Sodium cuprocyanide solution	UN 2317	101	1.75	Normal	B	6.35 mm	
Sodium cyanide solution	UN 1689	101	2.67	Special	Prohibited	6.35 mm	
Sodium fluoride, solution	UN 1690	101	1.75	Normal	B	Standard	
Sodium hydrogen sulfate, solution	UN 2837	101	1.75	Normal	B	6.35 mm	
Sodium hydroxide solution	UN 1824	101	1.75	Normal	B	Standard	
Sodium methylate, alcohol solutions	UN 1289	101	1.75	Normal	B	Standard	
Sodium perchlorate, solution	UN 1502	101	1.75	Normal	B	Standard	
Spirits of nitroglycerin, ([1 to 10%]) ([Nitroglycerin, solutions in alcohol])	UN 1204	Not authorized for transportation in IM101 or IM102 tanks					
Strontium chlorate, solution	UN 1506	101	1.75	Normal	B	Standard	
Strontium perchlorate, solution	UN 1508	101	1.75	Normal	B	Standard	
Styrene monomer, [inhibited]	UN 2055	102	1.0	Normal	A	Standard	
Sulfur chloride	UN 1828	101	2.67	Special	Prohibited	8 mm	
Sulfuric acid	UN 1830	101	1.75	Normal	Prohibited	8 mm	
Sulfuric acid, fuming	UN 1831	101	2.67	Special	Prohibited	8 mm	
Sulfuric acid, spent	UN 1832	101	1.75	Normal	Prohibited	8 mm	
Sulfurous acid	UN 1833	101	1.75	Normal	B	Standard	
Sulfur trioxide, [inhibited]	UN 1829	101	2.67	Special	Prohibited	8 mm	
Sulfuryl chloride	UN 1834	101	2.67	Special	Prohibited	8 mm	
Sulphur, molten	UN 2448	101	1.75	Normal	Prohibited	Standard	
Tars, liquid ([including cutback asphalt])							
(a) Flashpoint below 32 deg F	UN 1999	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1999	102	1.0	Normal	A	Standard	
Terpene hydrocarbons not listed by name in this table	Various	102	1.0	Normal	A	Standard	
Terpinolene	UN 2541	102	1.0	Normal	A	Standard	
Tetrachloroethane	UN 1702	101	2.67	Normal	B	Standard	
Tetrachloroethylene	UN 1897	102	1.0	Normal	A	Standard	
Tetraethyl dithiopyrophosphate, liquid	UN 1704	Not authorized for transportation in IM101 or IM102 tanks					
Tetraethyl dithiopyrophosphate mixtures, [See] Poisonous liquid							
Tetraethylenepentamine	UN 2320	102	1.0	Normal	B	Standard	
Tetraethyl lead	UN 1649	Not authorized for transportation in IM101 or IM102 tanks					
Tetraethyl pyrophosphate, liquid	NA 2783	Not authorized for transportation in IM101 or IM102 tanks					
Tetraethyl pyrophosphate mixtures, [See] Poisonous liquid							
Tetraethyl silicate	UN 1292	102	1.0	Normal	A	Standard	

(1) Hazardous Materials Descriptions (many of these descriptions are not proper shipping names. See 172.101 for proper shipping name)	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
1,2,3,6-Tetrahydrobenzaldehyde	UN 2498	102	1.0	Normal	A	Standard	
Tetrahydrofuran	UN 2056	101	1.75	Normal	B	Standard	
1,2,3,6-Tetrahydropyridine	UN 2410	101	1.75	Normal	B	Standard	
Tetrahydrothiophene	UN 2412	101	1.75	Normal	A	Standard	
Tetramethyl ammonium hydroxide, liquid ([or solution])	UN 1835	101	1.75	Normal	B	Standard	
Tetramethylsilane	UN 2749	101	4.0	Normal	Prohibited	6.35 mm	
Tetrapropyl orthotitanate	UN 2413	101	1.75	Normal	B	Standard	
Thiacetic acid	UN 2436	101	1.75	Normal	B	Standard	
Thioglycolic acid	UN 1940	101	1.75	Normal	B	Standard	
Thionyl chloride	UN 1836	101	2.67	Special	Prohibited	8 mm	
4 Thiopentanal	UN 2785	101	1.75	Normal	B	Standard	
Thiophene	UN 2414	102	1.0	Normal	B	Standard	
Thiophosgene	UN 2474	101	2.67	Normal	B	Standard	
Thiophosphoryl chloride	UN 1837	101	1.75	Special	Prohibited	Standard	
Tinctures, medicinal							
(a) Flashpoint below 32 deg F	UN 1293	101	1.75	Normal	B	Standard	
(b) Flashpoint 32 deg F or above	UN 1293	102	1.0	Normal	B	Standard	
Tin tetrachloride, anhydrous ([stannic chloride, anhydrous])	UN 1827	101	1.75	Normal	B	6.35 mm	
Titanium tetrachloride	UN 1838	101	1.75	Special	Prohibited	6.35 mm	
Toluene	UN 1294	102	1.0	Normal	A	Standard	
2,4-Toluenediamine	UN 1709	101	1.75	Normal	A	Standard	
Toluene diisocyanate	UN 2078	101	2.67	Normal	B	Standard	
Toluene sulfonic acid [See] Alkyl, aryl or toluene sulfonic acid							
Toluidines	UN 1708	101	2.67	Normal	B	Standard	
Triallylamine	UN 2610	101	1.75	Normal	B	Standard	
Tributylamine	UN 2542	102	1.0	Normal	B	Standard	
Trichloroacetic acid solution	UN 2564	101	1.75	Normal	B	Standard	
Trichloroacetyl chloride	UN 2442	101	1.75	Normal	Prohibited	6.35 mm	
Trichlorobenzenes, liquid	UN 2321	101	1.75	Normal	A	Standard	
Trichlorobutene	UN 2322	101	1.75	Normal	B	Standard	
1,1,1-Trichloroethane	UN 2831	101	1.75	Normal	A	Standard	
Trichloroethylene	UN 1710	102	1.0	Normal	A	Standard	
Trichlorosilane	UN 1295	101	4.0	Special	Prohibited	6.35 mm	
Tricresylphosphate	UN 2574	101	1.75	Normal	B	Standard	
Triethylamine	UN 1296	101	1.75	Normal	B	Standard	
Triethylenetetramine	UN 2259	101	1.75	Normal	B	Standard	
Triethyl phosphite	UN 2323	102	1.0	Normal	A	Standard	
Trifluoroacetic acid	UN 2699	101	2.67	Special	Prohibited	8 mm	
Triisobutyl aluminum	UN 1930	Not authorized for transportation in IM101 or IM102 tanks					
Triisobutylene	UN 2324	101	1.75	Normal	A	Standard	
Triisopropyl borate	UN 2616	101	1.75	Normal	B	Standard	
Trimethyl acetyl chloride	UN 2438	101	1.75	Normal	B	6.35 mm	
Trimethylamine, aqueous solutions ([with not more than 30 percent trimethylamine by weight])	UN 1297	101	2.67	Normal	B	Standard	
1,3,5-Trimethylbenzene	UN 2325	102	1.0	Normal	A	Standard	

IM TANK TABLE
January 1, 1981

(1) Hazardous Materials Descriptions [many of these descriptions are not proper shipping names. See 172.101 for proper shipping name]	(2) ID Number	(3) IM Tank Type	(4) Lowest MAWP in bars	(5) Pressure Relief Devices	(6) Bottom Outlets	(7) Minimum Shell Thickness	(8) Special Requirements
Trimethyl borate	UN 2416	101	2.67	Normal	B	Standard	
Trimethylchlorosilane	UN 1298	101	2.67	Normal	B	6.35 mm	
Trimethylcyclohexylamine	UN 2326	102	1.0	Normal	B	Standard	
3,3,5 Trimethyl-hexamethylene diamine	UN 2327	101	1.75	Normal	A	Standard	
Trimethylhexamethylene diisocyanate	UN 2328	101	1.75	Normal	B	Standard	
Trimethyl phosphite	UN 2329	102	1.0	Normal	A	Standard	
Tripropyl aluminum	UN 2718	Not authorized for transportation in IM101 or IM102 tanks					
Tripropylamine	UN 2260	101	1.75	Normal	B	Standard	
Tripropylene	UN 2057	102	1.0	Normal	A	Standard	
Tris (1 aziridinyl) phosphine oxide, ([solutions])	UN 2501	101	1.75	Normal	B	Standard	
Turpentine	UN 1299	102	1.0	Normal	A	Standard	
Turpentine substitute	UN 1300	102	1.0	Normal	A	Standard	
Undecane	UN 2330	102	1.0	Normal	A	Standard	
Valeraldehyde	UN 2058	102	1.0	Normal	A	Standard	
Vinyl chloride	UN 2502	101	1.75	Normal	B	Standard	
Vanadium oxytrichloride	UN 2443	101	1.75	Normal	B	6.35 mm	
Vanadium tetrachloride	UN 2444	101	1.75	Normal	B	6.35 mm	
Vinyl acetate, [inhibited]	UN 1301	101	1.75	Normal	B	Standard	
Vinyl butyrate	UN 2838	101	1.75	Normal	A	Standard	
Vinyl chloroacetate	UN 2589	101	2.67	Normal	B	Standard	
Vinyl ethyl ether, [inhibited]	UN 1302	101	2.67	Normal	B	Standard	
Vinylidene chloride, [inhibited]	UN 1303	101	4.0	Special	B	Standard	a
Vinylisobutyl ether, [inhibited]	UN 1304	101	1.75	Normal	B	Standard	
Vinyl toluene, mixed isomers, [inhibited]	UN 2618	102	1.0	Normal	A	Standard	
Vinyltrichlorosilane, [inhibited]	UN 1305	101	2.67	Normal	B	6.35 mm	
Wood preservatives, flammable							
(a) Flashpoint below 32 deg F	UN 1306	101	1.75	Normal	A	Standard	
(b) Flashpoint 32 deg F or above	UN 1306	102	1.0	Normal	A	Standard	
Xylene ([mixed])	UN 1307	102	1.0	Normal	A	Standard	
Xylenols	UN 2261	101	1.75	Normal	B	Standard	
Xylidines	UN 1711	101	2.67	Normal	B	Standard	
Xylyl bromide	UN 1701	Not authorized for transportation in IM101 or IM102 tanks					
Zinc chloride solution	UN 1840	101	1.75	Normal	A	Standard	

IM TANK TABLE
January 1, 1981

For explanation of abbreviations and reference marks, see last page of this tariff.

EXPLANATION OF ABBREVIATIONS, DEFINITIONS AND REFERENCE MARKS
(See §171.6 Definitions and Abbreviations)

Abbreviation or Reference Mark	EXPLANATION
°C	degree Centigrade (Celsius)
DOT	Department of Transportation
d/b/a	doing business as
etc.	Et cetera (and other things, or the rest; and so forth)
°F	degree Fahrenheit
FMC	Federal Maritime Commission
ICC	Interstate Commerce Commission
oz.	Ounces
t/d/b/a	Trading and doing business as
U.S.	United States
viz.	Namely
Vol.	Volume
°	Degree
%	Indicates percent
Ⓦ	Indicates water carrier operating under ICC jurisdiction
Ⓡ	Indicates railroad
Ⓒ	Carrier's participation canceled; no further application.
Ⓕ	Indicates freight forwarder
§	Indicates 'Section' number.
¶	Indicates 'Part' number.
‡	This tariff, as amended, is applicable in connection with California intrastate rates only where tariffs making reference hereto specifically so provide.
Ⓖ	Except as noted.
Ⓔ	Except as noted. The carrier 'alpha' codes listed herein represent only those carriers participating in the ATA Hazardous Materials Tariff. For a complete listing of all assigned alpha codes, see the Directory of Standard Multi-Modal Carrier and Tariff Agents Codes, ICC NMF 101, published by the National Motor Freight Traffic Association, Inc., 2200 Mill Road, Alexandria, VA 22314.
