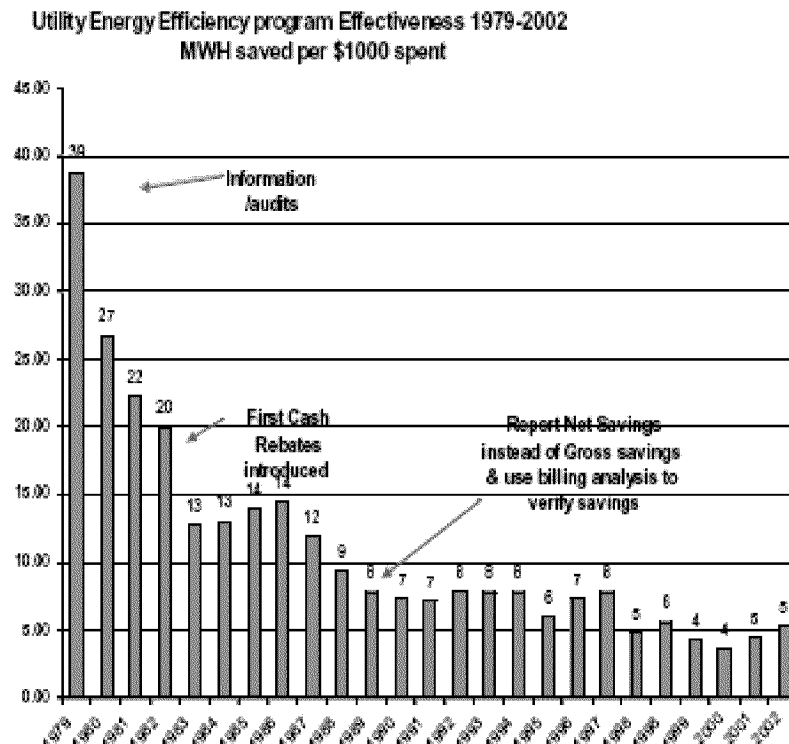

Figure 5
Trends in Utility Energy Efficiency Program Effectiveness

The downward trend in Figure 5 can be explained by major changes in both the composition of energy efficiency programs and measurement methods over time. At the beginning of the cycle, most of the utility programs provided recommendations via audits and information booklets but did not provide funds to reduce the cost of measures. Throughout the 1980s the program mix shifted toward offering customer rebates for specific measures which as Figure 2 decreased the yield or kWh per dollar of program spending.
