All,

Provided below is some information we gathered from Kern Division T&R this morning. The incident cause is still unknown, but a PG&E employee took a picture of the gas release yesterday (see below), and it appears that the gas release was through the relief valves on the Mojave pipeline. The location is at the [Redacted] in Arvin, CA (23 miles southeast of Bakersfield). There are no reports of injuries, fatalities, or ignition.

Mojave Pipeline Operating Company (owned by El Paso) has declared a force majeure (i.e., unable to meet contract obligations due to unanticipated event) to support investigation of this incident and has shut in 30 customer meter locations affecting Chevron, Aera, Juniper, SoCalGas, Oildale, TCCWD, MacPherson Oil, Equilon, LaPaloma Generating, Sunrise Power, Calpine, and Berry Petroleum.

This incident occurred about [Redacted] of our Line 300A & B right of way. There is no impact to our system or customers, although PG&E has picked up a cogen load to supply gas to meet electric demand. Currently, we are on standby to support two additional cogen loads. As such, Kern Division T&R has developed a plan to support cogen customers as follows:

- 1) T&R will proceed to the Badger Creek and Live Oak Cogens and determine that the equipment is fully operational. The equipment has been maintained every year and has been found to be in good working order.
- 2) T&R personnel will be at the temporary SOCALGAS tap and monitor and operate the bypass valve if needed
- 3) [Redacted] of ES&S has contacted Badger Creek and Live Oak and was notified that they are ready to operate if needed, and will be using 408 MCFH each. We are waiting final word that the two units are needed and Roger will contact [Redacted] to proceed.
- 4) [Redacted], gas transmission planner has reviewed the pipeline capacities, and has approved the operation.
- 5) T&R personnel will be present at the startup of the Badger Creek and Live Oak cogens in case there are any problems.
- 6) The capacities and operational status of the other four cogens will be determined the following day.
- 7) The Line 142N hydrostatic testing will be completed and tied back in by this Friday, May 4, 2012.

We'll provide more information as we receive through PHMSA or other sources.

WR's Accident Coordinator just talked with El Paso personnel. This release is on El Paso's Mojave Pipeline which is an interstate pipeline regulated by PHMSA's WR. The release is in an area where the Mojave line bifurcates just outside Redacted Redacted in Alvin, CA. The line comes in from the east and flows both N & S from this point. Pressure is regulated from ~1200 psig down to ~911 psig at this point. There is an above ground manifold with 4 relief devices at the release point. The operator is reporting that the pressure in the line appears to have been ~560-600 psig but a relief went off and somehow a leak resulted underground. They have isolated the lines and are

allowing the gas to blow down before they will be able to get to the site to excavate. They do report that there does not appear to be any obvious vehicular damage to the above ground installation. The line is at 10 psig now so they will get into the site soon. They have been able to see two damaged/broken relief valves in the area. Operator personnel are onsite and are gearing up to get into the site and document the area. Excavation will occur after that.

The operator will call the WR as soon as the line is blown down and personnel can get to the release site and ascertain what occurred. A map of the general area is attached.
