Suggested Safety Performance Metrics	2
Appendix A. Example Safety Culture Surveys	7
Appendix B. CPUC GO 167 Root Cause Analysis Standard	13

Chris Parkes Sr. Utilities Engineer California Public Utilities Commission Safety and Enforcement Division Risk Assessment Section of that Gas, Safety and Reliability Branch 505 Van Ness Avenue San Francisco, CA 94102 (415) 703-1975

## **Suggested Safety Performance Metrics**

Below are comments supporting the adoption of specific safety performance metrics. Some of these metrics were discussed at the June 27 workshop. Some are currently used by utilities and industries as *leading* or *lagging* indicators of safety performance. In the context of process safety, The Center for Chemical Process Safety defines *Lagging Metrics* as a retrospective set of metrics that are based on incidents that meet the threshold of severity that should be reported as part of the industry-wide process safety metric. *Leading Metrics* are a forward looking set of metrics which indicate the performance of the key work processes, operating discipline, or layers of protection that prevent incidents.<sup>1</sup>

Five particular metrics are suggested below. Examples are included for how each metric may be implemented.

# 1. Safety Culture Metric (Leading Metric)

- Survey different classes and locations of workers using a standard set of questions on a defined schedule
  - i. Example: Survey 1/3 of workers annually

<sup>&</sup>lt;sup>1</sup> http://www.aiche.org/sites/default/files/docs/pages/CCPS\_ProcessSafety\_Lagging\_2011\_2-24.pdf

- b. Numerically score responses
  - i. Example: Adopt a numerical "Safety Culture Perception Index". The Contra Costa County Industrial Safety Ordinance requires industrial facilities to assess safety culture. See Appendix A for sample survey questions and a sample numerical safety culture index that Contra Costa provides as guidelines for industrial facilities. Similar survey questions may by tailored for the utility industry. The Navy and other organizations use surveys to assess safety culture.<sup>2</sup>
- c. Report on average numerical survey scores by worker class and location
- d. Report on metric trends

# 2. Incident Metric (Lagging Metric)

- a. Define incident types and criteria for classification as an incident. Include contract workers and the public in this metric.
  - i. Examples:
    - 1. Fatalities and injuries requiring in-patient hospitalization
    - 2. Property damage exceeding \$50,000

<sup>&</sup>lt;sup>2</sup>http://cchealth.org/hazmat/pdf/iso/section\_f.pdf

http://cchealth.org/hazmat/pdf/iso/attachment e.pdf

https://www.safetyclimatesurveys.org/mainpage.aspx

http://www.dupont.com/products-and-services/consulting-services-process-technologies/operation-riskmanagement-consulting/uses-and-applications/safety-perception-survey.html

- Incidents resulting in significant public attention or media coverage
- b. Report annually on quantity of incidents by incident type.
- c. Report on metric trends

# 3. Lost Work Day Metric (Lagging Metric)

- Example: Number of injuries that result in Lost Work Days per 1000 employees
- b. Report on metric trends

# 4. Past Due Actions (Backlog) Metric (Leading Metric)<sup>3</sup>

- a. Define "Actions"
  - Example: Work Orders, including Maintenance, Repairs, Audits, Inspections, Upgrades, and Corrective Actions, including Corrective Actions identified from Root Cause Analyses

# b. Define "Past Due"

- i. Example: Company defined past due date for each Work Order
- c. Define Staffing Levels
  - i. Example: Define quantity of workers by worker classification
- Report annually on number of past due actions relative to number of actions broken down by category and location.

<sup>&</sup>lt;sup>3</sup> <u>http://www.aiche.org/sites/default/files/docs/pages/CCPS\_ProcessSafety\_Lagging\_2011\_2-24.pdf</u>

- e. Report annually on staffing levels by worker classification
- f. Report on metric trends
  - i. Past Due Actions (Backlog) and Staffing Level metrics are reported together as supplemental indicators of adequate staffing.

# 5. Root Cause Analysis Program Effectiveness (Lagging and Leading Metric)

a. Define Criteria for Events or Conditions that warrant a Root Cause

Analysis ("RCA Triggers")<sup>4</sup>

- i. RCA Trigger Examples:
  - 1. Incidents as defined in the Incident Metric described earlier
  - 2. "Near Misses" as defined by the company
    - a. Example: An undesired event that under slightly
       different circumstances could have resulted in harm to
       people, damage to property, equipment, or
       environment.<sup>5</sup>
    - b. Example: Lockout/Tagout process failures. An incident did not occur, but it could have.
  - Recurring work low priority orders that, when aggregated together, are significant.

<sup>&</sup>lt;sup>4</sup> CPUC General Order 167: See Appendix B

<sup>&</sup>lt;sup>5</sup> http://www.aiche.org/sites/default/files/docs/pages/CCPS\_ProcessSafety\_Lagging\_2011\_2-24.pdf

# a. Example: Low priority leak repairs

- b. Report annually on the number of RCA Triggers
- c. Report annually on the number of RCA Triggers by root cause category. Typically events and conditions that trigger a Root Cause Analysis, have multiple root causes.
- d. Report annually on the number of Root Cause Analyses completed
- e. Report annually on the number of Root Cause Analysis Corrective Actions completed compared to the number of Corrective Actions identified in the Root Cause Analyses
- f. Report on metric trends
  - i. Example: Number of RCA Triggers by root cause category

While some metrics may not be suitable for direct comparison between utilities, trends in metrics at a particular company will provide information to the company and regulators on the effectiveness and performance of company programs in improving safety.

43.	I feel free to refuse to participate in work activities that are unsafe		2	D	•	3
44.	Operators are empowered to take corrective action as soon as possible (including shutting down when appropriate) if safety critical interlocks, alarms, or other process safety-related devices fail or become unavailable during operation		2	۵	٤	3

Please provide any comments you have about Worker Professionalism / Empowerment in the space below.

	Process Safety Training					
Note: know	Note: For each statement below, you should select "3" under the response labeled "?" only know or you do not have an opinion.					
	Tend to					
	Tend to Agr	Agree				
45.	The training that I have received does not provide me with a clear understanding of the process safety risks at my refinery					
46.	I know how to access appropriate process safety resources if I need them					
47.	The following receive the necessary process safety training to do their job safely:					
	a. New workers					
	b. Experienced workers					
	c. My supervisor					
	d. Contractors					
48.	The process safety training that I have received allows me to recognize when a process should be shut down if safety critical interlocks, alarms or other process-safety devices fail or become unavailable during operation					
49.	The process safety training that workers receive at my refinery is adequate to prevent process-related incidents, accidents and near misses	12343				

# Appendix B

CPUC General Order 167, Maintenance and Operation Standards

for Electric Generating Facilities

Maintenance Performance Standard 4.

(Covers Root Cause Analysis)<sup>8</sup>

# MS 4 - Problem Resolution and Continuing Improvement

## **Performance Standard**

The company values and fosters an environment of continuous improvement and timely and effective problem resolution.

## **Assessment Guidelines**

### A. Self-Assessment

Self-Assessment activities are used to compare actual performance to management's expectations, and to identify and correct areas needing improvement. While self-assessments, by definition, are driven from within, they may be used to measure internal performance to external criteria, such as ISO, EPA or OSHA. Self-assessment is both a discreet activity and a continuous process that includes such activities as: Dedicated teams, with a specific chartered objective to assess certain program(s) or element(s).

<sup>&</sup>lt;sup>8</sup> <u>ftp://ftp.cpuc.ca.gov/ElectricGenerationPerf/Maintenance\_Standards\_Final\_Renumbered.doc</u>

Management monitoring of on-going performance through performance metrics or problem resolution process monitoring.

Discreet event investigations

# B. Problem Reporting, Root-Cause Analysis, and Corrective Actions

A systematic approach and process is used to identify and report problems, determine the cause(s) and establish corrective actions to prevent recurrence. Attributes of successful programs include:

Encouraging employees to report problems at low thresholds of significance.

Using a graded approach to significance, and performing more extensive root cause determination to those problems having high significance, and trend and track those with low significance.

Trending capability on information such as "cause code" or equipment or process involved.

Tracking of corrective actions to closure.
