Subject: Two filings this afternoon -- FYI

FYI: two Errata filings this afternoon. In both cases all the segments have been successfully hydrotested to a pressure that supports their prior MAOP. Now they are operating at an actual pressure that is below MAOP.

The Class OII errata describes an update to one pipeline segment (0.15 miles) that previously changed up to a higher class and requires a lower MAOP. That change has been made and it's operating below the new MAOP.
