The armrests were bare plastic, and they said in real life they'd be aluminum. Sigh. By the way, they fucked up the loops on the backs of the seats. The loops that are there now, the rubber-coated aluminum ones, are a real triumph of design.

Armrests suck, but will help discourage the indigent from setting up camp on cold and rainy days.

As a smaller person, armrests are my best ally in keeping XXXL Americans from slopping into my lap.

What material are they made out of? It should be like a Denny's booth, or something inexpensive to replace, easy to clean & sanitize, and reasonably cushiony.

MC

They're not that great. Narrower, a tiny bit of centering. Armrests (yuk). But they seem to want to choose between armrests and loops on the backs of the chairs.

Do I seem terse? Blame the thumb keyboard.
