Subject:	NEM Queue
Scott,	
they have	e some points that our folks pulled together on the queue issue that we discussed, as some concerns. Not sure where things are in the process but thought I would send up in case the issue is still being considered.
Hope you	have a great weekend!
Thanks,	
Meredith	
	The use of a queue could be abused (queue hogging, selling customers on a free or otion") and create customer confusion.
	Solar companies will have time to educate and prepare their customers for the fact that be a shorter grandfathering period for systems installed after the step down date.

• Solar companies are used to having to schedule and complete projects before a year-end deadline. We always see a surge of installs in December to maximize tax benefit value. For example, at the end of 2013 50% bonus depreciation expired.

• Interconnection is not a bottleneck. It is required to be completed within 30 days and currently the average time is less than 5 days.
