

### SHERMER L. SIBLEY 1913-1976

On July 16, 1976, death ended the distinguished career of Shermer L. Sibley. During 40 years of service with Pacific Gas and Electric Company, he rose from a modest initial job to President and then Chairman of the Board. He became a dedicated civic leader and an industrial statesman of national stature.

He played a major role for the past quarter century in the Company's achievements in serving the rapidly expanding energy demands of Northern and Central California. At a time of concern over the national energy crisis, he served in the highest post of the nation's electric utility industry as Chairman of the Edison Electric Institute.

He was admired and respected for his warm friendliness, for the energy and wisdom he devoted to educational and charitable institutions, and for his good humor and boundless talents.

With profound respect and affection this 1976 Annual Report is dedicated to the memory of Shermer L. Sibley.

# Highlights

	1976	1975	Increase (Decrease)
Operating Revenues	\$2,646,728,000	\$2,233,371,000	19 %
Net Income	\$ 301,984,000	\$ 251,579,000	20 %
Earnings Available for Common	\$ 238,299,000	\$ 203,278,000	17 %
Earnings Per Common Share	\$2.90	\$2.67	9 %
Dividends Per Common Share	\$1.88	\$1.88	_
Total Assets	\$7,344,832,000	\$6,620,883,000	11 %
Capital Expenditures	\$ 599,278,000	\$ 630,589,000	(5)%
Sales of Electricity to Customers (KWH)	56,559,826,000	52,786,443,000	7 %
Sales of Gas to Customers (MCF)	610,953,000	670,865,000	(9)%
Total Customers	5,708,567	5,570,185	2 %
Number of Stockholders	337,271	305,635	10 %
Number of Employees	24,583	24,987	(2)%

### To Stockholders

In this Report last year we expressed the belief that "earnings growth and an adequate return on investment to shareholders are in the process of being reestablished." Significant progress was made during 1976 toward the achievement of this objective. and we are pleased to report that year-end 1976 earnings per share were \$2.90, an increase of 23 cents over 1975. As a result, and in recognition of the expanding investment by our stockholders, the Board of Directors has increased the common stock dividend from \$1.88 to \$2.00 on an annual basis effective with the April 1977 dividend payment.

We have diligently sought regulatory approval for rate increases that will assure adequate service to our customers and provide a reasonable return for our stockholders. The decisions of the California Public Utilities Commission on our requested rate adjustments have been sufficiently responsive to our needs to justify guarded optimism for the future.

In April the California Commission authorized a new Energy Cost Adjustment Clause (ECAC) for our electric rate schedules. This superseded a method of adjusting rates on the basis of projected fossil fuel costs with a procedure based upon the actual costs of all fuels used for electric

generation and the cost of purchased energy. Under the new ECAC procedure, dramatic swings in energy mix or energy costs resulting from weather or other conditions will no longer affect our earnings.

The Company has received approval by the Commission of a somewhat similar procedure for adjusting gas rates to offset higher prices charged for natural gas by our suppliers. This procedure, together with the ECAC, insures recovery of costs which collectively account for approximately 50% of the Company's total annual revenues.

In August the Commission rendered its decision in our general rate case. This decision authorized increases in electric and gas rates which are expected to produce an additional \$176 million in annual revenues. The Commission concluded that this increase should provide a 9.2% overall return and a 12.83% return on common equity. Although these levels of return remain below those which the Company considers to be fair and reasonable. we are encouraged by the improvement this decision represents over the 8.65% overall return and 12.00% return on equity approved by the Commission for the Company a year earlier. The Commission reduced regulatory lag in this case by deciding it only ten months after the prehearing conference. As a further indication of its intention to reduce regulatory lag, the Commission expressed a willingness to consider rate adjustments necessitated by major additions to plant, such as the Company's Diablo Canyon nuclear units, when they become operable rather than delay such adjustments to the time of a general rate case decision. The Commission's expressed determination to reduce regulatory lag in future

rate proceedings will improve the prospects for earning our allowed rate of return. To date, however, rapidly rising costs have prevented the Company from earning the returns found reasonable by the Commission, and we intend to apply at about the end of April for additional increases in our general gas and electric rates.

The ability to obtain timely regulatory approvals for new electric generating and natural gas facilities is at the forefront of the challenges confronting the Company. Despite our continuing emphasis on, and the effectiveness of, energy conservation, sales of electricity increased nearly 7% over the prior year. Although much of this increase was attributable to a stronger industrial demand resulting from improved economic conditions and greater agricultural irrigation pumping caused by below-average precipitation, our studies show that a long-term growth rate of 5% annually in the demand for electricity can be expected in our service area.

To meet this growth we are pursuing plans to develop many sources for electric generation, for it is our belief that no single source should be depended upon to supply all future needs. It is clear, however, that for future additions to our system, primary reliance must be on nuclear power and coal, the nation's two most abundant energy sources. Approximately 40% of our capacity additions for the next five years will be represented by the two nuclear units at Diablo Canyon when they become operational. In addition, we are preparing to file a "Notice of Intention" with the California State Energy Commission for our second twounit nuclear plant on one of three

sites being considered in the Central Valley area of California. The Company is also investigating four sites for the location of its first coal-fired power plant. Development of our geothermal power capacity is continuing in The Geysers area, and construction is under way on our Helms pumped storage hydroelectric project.

The diversity of our generating resources has been a hallmark of the PG&E system. It has withstood the test of time from the standpoint of service reliability and cost effectiveness, and remains our goal in meeting the energy needs of the future. This is the subject of our special report beginning on page 11. In furtherance of this goal we have increased our support of research in the fields of solar, wind, and other electric generating technologies.

Your Company also made significant progress in 1976 toward the purchase of coal and uranium reserves required for future electric generation. After nearly a year of confirmation drilling, the Company exercised its option to purchase a coal reserve located near Price, Utah. This reserve, estimated to contain 150 million tons of low-sulfur coal, will provide a portion of the fuel needs for our proposed coal-fired generating units planned for completion in the 1980's. To supplement our existing uranium supplies, the Company also executed an agreement providing for extraction and purchase rights of uranium from properties located in Texas, and is negotiating for the purchase of an interest in uranium properties located in Wyoming.

In recent years, deliveries of natural gas to us have declined as a result of the dwindling supplies available from El Paso Natural Gas Company and California producers. This has resulted in reduced supplies of gas to our power plants and frequent curtailments of service to interruptible industrial customers since 1972. If our supplies of natural gas from existing sources come reasonably close to current projections, residential and other high priority customers will continue to be fully served until the middle 1980's.

Accordingly, we have intensified our efforts to procure additional long-term supplies from other sources. Our proposed liquefied natural gas projects, based upon reserves in Alaska and Indonesia, both joint ventures with Southern California Gas Company, are still awaiting authorization from the Federal Power Commission. If granted timely regulatory approvals, these projects could provide approximately 20% of our gas supplies by the early 1980's.

Your Company has also continued its active participation in the Arctic Gas pipeline project, which would connect Alaskan gas fields in Prudhoe Bay and Canadian gas fields in the Mackenzie Delta region with markets east and west of the Rockies in the U.S. and in Canada. The Administrative Law Judge assigned to the Arctic Gas proceeding before the Federal Power Commission has recommended approval of this project. A recommendation by the Federal Power Commission must be forwarded to the President by May 1, 1977, and the President must submit his decision to Congress for ratification on or about September 1, 1977. If the Arctic Gas Project is selected, additional gas supplies could be available to the California market by the early

1980's. We are also continuing our gas exploration efforts in the Rocky Mountain area, and we have recently applied to the California Commission for customer funding to permit an expansion in our overall exploration program.

On July 21 the Board of Directors elevated the undersigned to their present positions. Later in the year additional changes were made in order to achieve a better-balanced organization and strengthen the management capability of the Company. These are described in a special section which follows on page 10.

We have made significant progress in many aspects of our business this past year and believe we have established a solid foundation for meeting the many challenges of the future. We commend the efforts of our employees who have made this possible and sincerely thank them for their dedication in meeting the growing needs of our customers.

President and Chief Executive Officer

An Fin

Richard H. Peterson

Chairman of the Board of Directors

For the Board of Directors, February 24, 1977

# Financial and Rates

Operating revenues for 1976 amounted to \$2 billion 647 million, an increase of \$413 million. or 19%, over 1975. Electric revenues contributed about 59% of the total, and gas revenues 41%. Operating expenses were \$2 billion 243 million, an increase of \$357 million, or 19%, over 1975. This increase resulted primarily from the higher cost of natural gas, increased usage of expensive fuel oil for electric generation due to the dry year, and increased purchases of power from other producers.

Net income for the year amounted to \$302 million, an increase of \$50 million over 1975. After preferred dividend requirements of

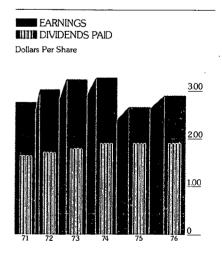

\$64 million, \$238 million was available for common stockholders. This was equivalent to \$2.90 a share, an increase of 9% over the \$2.67 a share earned last year. The number of outstanding common shares was increased during the year by 11% to a total of 88,610,611.

The quarterly common stock dividend was increased 3 cents a share effective with the April 15, 1977 payment. The annual dividend rate now in effect is \$2.00 per share. Dividends declared on the common stock during 1976 amounted to \$155 million, or 65% of the total earnings available for common stock.

Several rate decisions during 1976 were the primary reason for the increase in operating revenues. The most significant of these occurred on April 27 when the California Public Utilities Commission adopted a new Energy Cost Adjustment Clause. This permits the Company to recover the actual cost of energy used in generating electricity. Previously, rates were based upon estimated oil and gas fuel costs for average-year hydroelectric conditions. The new procedure provides for semiannual

adjustments in electric rates based upon the costs actually incurred during the preceding 12-month period for all fuels used to generate electricity and for electric energy purchased from others. Costs in excess of those currently billed to customers are deferred for accounting purposes from the time they are incurred until they are recovered, with interest, through rate adjustments. Such unbilled recoverable electric energy costs, together with interest thereon, approximated \$252 million at the end of 1976. Since these costs are currently deductible for tax purposes, the Company will receive a substantial Federal income tax refund for the year 1976. This also explains in large measure why, as previously reported, 100% of the Company's common and preferred stock dividends during 1976 were excludable from gross income for individual Federal tax purposes.

The California Commission authorized the first rate increase under this new procedure on June 15 in the amount of

\$73 million annually. An additional increase of \$144 million for the first six months of 1977 became effective January 5, 1977.

During 1976 the Company also received approval for seven separate changes aggregating \$215 million annually to offset price increases from our suppliers of natural gas.

On August 24, 1976, the Commission issued an interim decision in our general rate case authorizing increases in the Company's electric and gas rates in amounts expected to produce additional annual revenues of \$106 million and \$70 million, respectively. The Commission determined that a 9.2% overall rate of return and a 12.83% rate of return on common equity were fair and reasonable. Hearings are still in progress on the issues of conservation, rate design, and the reasonableness of the allowance for income taxes. Unfortunately, the rates charged for our services have lagged markedly

behind the costs incurred to provide them. Although the Commission has expressed its determination to reduce regulatory lag and is diligently working toward this end, rapidly increasing costs have prevented the Company from achieving the authorized levels of return. Accordingly, we intend to apply for additional general rate relief by the end of April 1977.

Rate proceedings still pending include an application for a Gas Exploration and Development Adjustment rate provision. This would permit periodic rate adjustments to offset the costs incurred for Commission-approved gas exploration and development projects.

Construction expenditures amounted to \$599 million during 1976. The external financing requirements for these and other expenditures were supplied by three security issues. In March \$106 million was raised through the issuance of preferred stock at a cost to the Company of 9.59%; in September \$163 million was obtained through the direct sale of common stock: and in November \$175 million of First Mortgage Bonds was issued at a cost to the Company of 8.35%. An additional \$25 million was

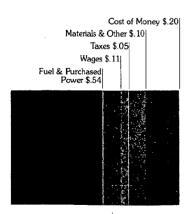

raised through the issuance of common stock to the Dividend Reinvestment Plan and the Employees Stock Purchase Plan.

The Company's capitalization at year end totaled \$6.5 billion consisting of 48.1% in mortgage bonds, 13.5% in preferred stock and 38.4% in common stock equity. There were then more than 210,000 common shareholders and 120,000 preferred shareholders.

### Electric

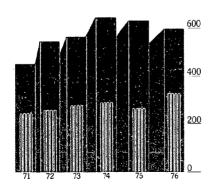

The Company's electric operations in 1976 showed the effects of the severe drought throughout PG&E's service territory. Electric energy sales increased 7% to 56.6 billion kilowatt-hours. A significant portion of the increase was due to drought-induced heavy pumping loads for agricultural irrigation. Industrial sales

Millions of Dollars

were also substantially higher, reflecting improved economic conditions.

Because of adverse hydroelectric conditions, the proportion of thermal-electric generation was much higher in 1976. Of the total system output, approximately 62% was provided by thermalelectric generation at the Company's own plants. The remaining 38% was provided by hydroelectric generation at Company plants and by purchases from other producers. This reversed the trend of the previous two years, when very favorable water conditions enabled PG&E to use less expensive hydroelectric generation for more than half its output.

Under the drought conditions experienced in 1976, the Company burned nearly 27 million barrels of low-sulfur oil in its thermal generating plants, an increase from 11 million barrels burned in 1975

On June 28 a new record peak demand of 12,245,800 kilowatts was recorded, representing an increase of 5.3% over the previous year's peak. Our studies indicate that sales of electricity will continue to grow in our service area despite our continuing emphasis on energy conservation. To meet this growth, additional generating capacity will be required. In recognition of the growing scarcity of oil and gas, we have planned the major portion of these additions to use other fuels

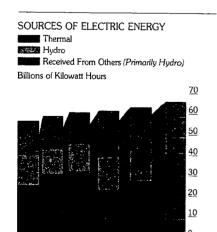

Our two nuclear units at Diablo Canyon represent 43% of the capacity additions expected to become operational during the next five years. When in full operation, these two units will save about 24 million barrels of fuel oil annually.

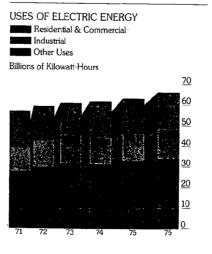

The Geysers will be the site of nearly 13% of our capacity additions during the next five years. It is already the world's largest geothermal facility, providing 502,000 kilowatts of capacity. Construction has started on four additional units which will bring the capacity to 908,000 kilowatts in 1979. We expect that at least two million kilowatts of capacity ultimately will be available from geothermal sources in The Geysers area.

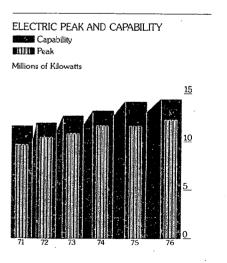

Construction began this year on the Company's 1,125,000-kilowatt capacity pumped storage hydroelectric project on the north fork of the Kings River. Upon its completion, expected in 1981, the Helms Project will provide additional peaking capacity. Peaking generation will be accomplished by discharging water stored in Courtright Lake through turbine generators located at Lake Wishon. The water then will be pumped back to Courtright Lake during off-peak hours, using power from thermal and other base-load plants to drive the pumps.

The Company is also proposing to construct an underground hydroelectric plant with a capacity of 140,000 kilowatts on the San Joaquin River. The plant would be located between two existing reservoirs and would require no new dams.

Coal is expected to become the Company's next source of energy for electric generation, supplementing the five sources currently available: nuclear, hydro, geothermal, oil and natural gas.

Two 800,000-kilowatt capacity coal-fired generating units are planned for construction in the 1980's.

The Company is undertaking to purchase currently a portion of its long-term supplies of fuel for future base-load thermal plants. This past year the Company purchased a coal reserve in Utah of sufficient tonnage to supply one 800,000-kilowatt generating unit for 40 years. Our future nuclear fuel requirements will be met in part from uranium properties located in Texas that were acquired in 1976. In addition, the Company is negotiating for the purchase of an interest in uranium properties located in Wyoming. Ownership interests in fuel supplies will help to stabilize the Company's costs of energy in future years.

Now, as in the past, PG&E's management must face the challenge of providing the energy needs of a growing and dynamic service area. No single source of energy is the answer to our needs. All feasible sources must

be developed and conservation must be vigorously pursued. Accordingly, we are investigating the feasibility of all promising methods of generating electricity, including fusion and breeder reactors, solar and wind power, and supporting research on a number of them. For additions to generating capacity in the next two or three decades, however, primary reliance must be placed on commercially available methods of generation and on the nation's most abundant fuel resources, uranium and coal.

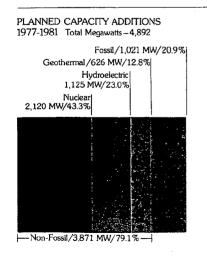

### Gas

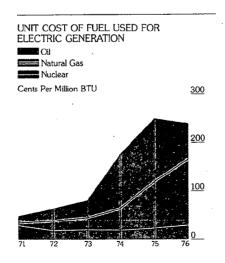

The Company currently obtains its natural gas supply from three sources: El Paso Natural Gas Company, which delivers gas from the southwestern part of the United States; Pacific Gas Transmission Company, a PG&E subsidiary which transports gas from Canada; and producers in northern and central California.

During 1976 the Company purchased 836 billion cubic feet of natural gas from these sources: 38% was obtained from El Paso, 45% came from PGT and the

remaining 17% was from California producers. The total volume acquired was 3% less than in 1975 and the lowest amount purchased since 1967. The reduced availability of natural gas is attributable to El Paso's declining supply and the manner in which that supply is being allocated by the Federal Power Commission and also to the declining deliverability of California wells.

As a result, the Company's low priority customers have periodically been curtailed during the past few winters, as have such classes of consumers elsewhere in the country. Gas supplies currently under contract are adequate to meet the needs of residential customers until the middle 1980's. By then, assuming timely governmental actions, the projects we have planned will be providing substantial additional supplies.

The Arctic Gas Project, a multicompany consortium of U.S. and Canadian companies, proposes to transport up to 4.5 billion cubic feet per day of gas from Alaska's Prudhoe Bay and the Mackenzie River Delta area of Canada for use in the United States and Canada. Applications for approval of this project are before regulatory agencies in both Canada and the United States. Hearings on the applications of Arctic Gas and two competing projects have been completed by the Federal Power Commission. On February 1, 1977, the Administrative Law Judge rendered his decision in favor of the Arctic Gas Project and the matter is now before the Commission for its review. Under the provisions of recently enacted Federal legislation, the Commission's recommendation must be forwarded to the President by May 1, 1977, and the President must submit his decision to Congress for ratification on or about

September 1, 1977. If the Arctic Gas Project is selected, natural gas deliveries could commence in 1982 or 1983.

The Company is also participating in a joint venture with Southern California Gas Company that would bring liquefied natural gas supplies by ship from Indonesia and from South Alaska's Cook Inlet. If approved, these projects could ultimately provide an additional 470 million cubic feet of gas per day for PG&E's customers. Hearings on these projects are in process before the Federal Power Commission.

The Company is continuing its exploration program in the Rocky Mountain area of the United States through two of its subsidiary companies, Natural Gas Corporation of California and Pacific Gas Transmission Company. Small volumes of gas from the Rockies are scheduled to flow into our system beginning this year, but sufficient data are not available to assess fully the future deliverability of gas from this source. Natural gas discovered in this area may someday be augmented with synthetic natural gas from coal to achieve quantities making pipeline transportation economically feasible.

Each of the Company's potential incremental supplies of gas will

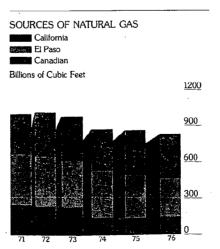

be more costly than present supplies because of the great distances and new technologies involved in bringing this gas to market. Even the cost of current supplies has risen dramatically in recent years. The average 1976 price of \$1.34 per thousand cubic feet has quadrupled over the price of gas paid just five years ago.

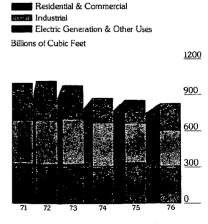

The Company is also augmenting its gas storage capability and its ability to deliver gas from storage to meet its peak requirements. The Company has three underground storage facilities and one liquefied petroleum gas installation for auxiliary peaking that are capable of a maximum daily delivery totaling 1.5 billion cubic feet.

### Regulation

The Company is subject to regulation by four principal agencies:

The California Public Utilities Commission has the authority,

USES OF NATURAL GAS

among other things, to establish rates, regulate security issues and prescribe rates of depreciation and uniform systems of accounts.

The Federal Power Commission has authority to regulate rates for interstate transmission and sales of electricity for resale, and to regulate the acquisition and disposition of certain property, licensing of hydroelectric projects and accounting. Pursuant to the Natural Gas Act, the FPC also exercises jurisdiction over the operations of the Company's domestic subsidiaries involved in the supply and transmission of natural gas in interstate commerce.

The California State Energy Resources Conservation and Development Commission has responsibility for forecasting electric energy requirements and for developing contingency plans for electric energy shortages. In addition, it has the authority to certify thermal-electric power plant sites and related facilities within California.

The Federal Nuclear Regulatory Commission has jurisdiction over the construction and operation of the Company's nuclear generating plants.

### Conservation

Since the onset of the energy crisis in 1973, the Company has steadily intensified efforts to help its customers conserve energy. Increased conservation can reduce the need for construction of new, high-cost utility plant and stretch scarce and costly supplies of gas, oil and other sources of energy.

In keeping with its commitment to treat energy conservation as the equivalent of another energy source, the Company has established an Energy Conservation and Services Department. In 1976 this department administered a program involving the expenditure of more than \$6 million designed to produce substantial energy savings for our customers. These efforts are being increased in 1977.

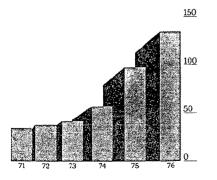

To expand still further our conservation programs, the Company is seeking authority from the California Public Utilities Commission to make additional expenditures for conservation under a procedure that would adjust customer rates to offset the costs of Commissionapproved PG&E conservation programs. The proposed programs include low-cost Company-funded home insulation

loans, technical analyses of larger customers' energy use and the allocation of additional funds for solar research and development. Our conservation policy is a logical complement to the planning essential in meeting the future energy needs of northern and central California.

### Personnel

There were 24.583 men and women employed by the Company at the end of 1976. Approximately 70% were represented by the International Brotherhood of Electrical Workers(AFL-CIO), and 8% by the Engineers and Scientists of California. The Company has reached an agreement with the representatives of the IBEW, subject to membership ratification, which provides for increases in benefits as well as wage increases of 74% effective January 1, 1977 and 6% effective

AVERAGE COST OF PURCHASED NATURAL GAS Cents Per MCF

January 1, 1978. Negotiations with the Engineers and Scientists of California are still in progress.

The Company's Affirmative Action Program has continued to achieve excellent results. Minority employees now represent over 22% of PG&E's work force, a figure which compares favorably with the minority working age population in our service area. In addition, advancement of minorities and women into supervisory and management positions has been actively encouraged. The Company is gratified by the success of its efforts to provide upward mobility for men and women of all backgrounds. More than 3,700 PG&E supervisors and foremen have attended incompany Supervisors Training Workshops, where they are trained in practical management skills and techniques.

PG&E employees are continuing their long-standing tradition of personal involvement in their communities. Many Company employees serve on the governing bodies or staffs of school boards, planning commissions, youth groups, and other civic and charitable organizations. We are proud of the good citizenship displayed by our employees.

### **Executive Changes**

Following the death of Shermer L. Sibley, the Board of Directors on July 21, 1976 elected John F. Bonner President and Chief Executive Officer, Richard H. Peterson Chairman of the Board, and Frederick W. Mielke, Jr., Executive Vice President and a Director.

In order to achieve a betterbalanced organization and strengthen the management of the Company, substantial organizational changes were made on December 15, 1976. On that date the Directors advanced J. Dean Worthington, Senior Vice President, to Executive Vice President and elevated three Vice Presidents — Barton W. Shackelford, Stanley T. Skinner and John A. Sproul—to Senior Vice President. Nolan H. Daines, formerly Land Department Manager, was elected Vice President - Planning and Research; Malcolm A. MacKillop, Assistant General

Counsel, became Vice President – Governmental Relations; and Paul Matthew, previously Manager of Steam Generation, became Vice President and Assistant to the Executive Vice President, Mr. Worthington.

This new executive structure relieves some of the burdens that had been placed upon the President and the Chairman of the Board by the growth of the Company, permits additional delegation of authority, and provides greater depth of senior management.

It is with great sorrow that we report the deaths of two of our Directors. On December 21, 1976, after having served on our Board of Directors for six years, Rudolph J. Drews passed away. Mr. Drews had resigned from his duties as a PG&E Director just one week earlier in anticipation of extensive travel abroad. Mr. Karl L. Wente, who had been elected a Director in October, died unexpectedly on January 22, 1977 at the age of 49.

# PG&E'S DIVERSE ENERGY SOURCES

PG&E EMPLOYS FIVE SOURCES OF PRIMARY ENERGY—FALLING WATER (hydro power), OIL, NATURAL GAS, NUCLEAR FUEL AND NATURAL STEAM (geothermal). All are used to produce the electricity for PG&E's system. They are drawn upon to the limits of availability (with oil the balancing fuel supply) to generate power at the highest efficiency and lowest possible cost.

We have available to us one of the nation's great hydroelectric systems. In normal rain and snowfall years, hydroelectric power provides about 50% of our electric energy. This type of electric generation neither contaminates nor consumes the water itself, but returns it to the rivers undiminished to serve agriculture and other vital needs. Hydroelectric facilities are expensive to build, but generally economical to operate. The resulting low energy cost is one reason why our rates, despite recent increases, remain among the lowest in the nation.

But since nearly all economically acceptable hydro sites have already been developed, oil and natural gas have become more prominent in our energy mix in recent years. Unfortunately, the costs of these fossil fuels have been skyrocketing. In just five years, the price for gas has quadrupled and the cost per barrel of low-sulfur fuel oil has quintupled.

One alternative to oil and gas is uranium. Nuclear power plants can produce electricity at significantly less cost than can an oil-fired plant. When operational, our two nuclear units at Diablo Canyon will save approximately 24 million barrels of expensive imported oil a year.

The remaining source of primary energy currently employed within our system is geothermal steam. We have the nation's only geothermal power development, the largest in the world, and we are expanding it. However, we estimate it will supply only about 10% of our needs when fully developed.

COAL WILL SOON BECOME THE SIXTH ENERGY SOURCE FOR PG&E. Reserves already purchased in Utah this past year and others which are being investigated will be used as fuel for two 800-megawatt coal-fired generating plants planned for operation in the mid-1980's.

CONSERVATION CAN BE CALLED OUR SEVENTH SOURCE

OF ENERGY. In order to supply the energy needs of our customers now and in the future, conservation must play an increasingly prominent role. The key to the effectiveness of our conservation effort is explaining the realities of an energy situation which is truly serious to a public which is only now coming to understand and respond to it. Too many people, as polls and experience alike demonstrate, fancy that the energy problem is nonexistent or trumped

up. But the hard fact is that the energy problem is very real. It will not go away and, unfortunately, will get worse before remedial actions can take effect.

No company, no industry, can serve its customers or its stockholders effectively when faced with massive and frequently critical public misunderstanding of the most fundamental facts of its operation.

Faced with the need to explain to its customers the realities of the energy situation and to tell them what the Company is doing about it, PG&E continued a major educational campaign in 1976.

Central to the 1976 effort was the widespread use of a series of dramatic advertisements in newspapers and magazines. The series (reproduced in reduced form here) depicted the Company's diverse sources of primary energy and was titled accordingly, "Sources of Energy".

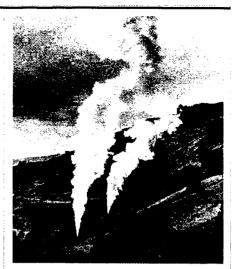

In pointing out the realities of the energy crisis and the need for conservation, the advertisements described briefly our sources of energy and why no single source can supply the needs of our customers—why all must be developed. They also called attention to PG&E's efforts to develop additional resources. including solar, wind, garbage and others. Realistically, they noted, some of these sources may take years to prove out and some may not make it at all—yet "in the meantime, we must meet your demands for electricity".

Each of the advertisements concluded with the frank statement: "For your part, the effective way to help control the spiraling cost of energy is to use less of it. We encourage you to do so because the energy you use is too precious...and too costly... to waste."

PG&E will continue this kind of customer communication so long as the need itself continues.

# If California let off enough steam, electricity would be cheaper.

### It's hot down below

more prominent in our energy why PG&E and other utility must continue, but conservations in recent years. Unfortu-

# If it rained all the time, electricity would be cheaper.

PG&E employs five sources of primary energy—oil, natural gas, natural steam (geothermal), nuclear fuel and failing water (hydro power)—to turn turbo-generators which produce the electricity for its interconnected network system. They are mixed "for maximum efficiency to generate power at the lowest possible cost.

To harmess water for power, we have built one of the nation's greatest hydroelectric systems. It was a fixed by the product of the product o

ating plants. Hydro generation neither contaminates nor consumes the water itself. It is returned to the

reach users. It is returned to the rivers undiminished, to serve agriculture and other vital needs. Building hydroelectric facilities is expensive, but they are economical to operate. The low cost of hydroelectricity is one reason why our rates, despite recent for the server for the server

### Diversity: Other sources of energy

Oil and natural gas have become more prominent in our energy mix in recent years because nearly all economically acceptable hydro sites have been developed. But the costs of these fossal fuels have been skydeveloped. But the costs of these fossi fuels have been sky-rocketing. In just 3 years, the prices for gas have more than doubted and the cost per barrel of low-suffer intel oil has quintupled. All but two of the PG&E-devent rate increases requested in the past five years are to offset these higher ware to offset these higher ware to offset these higher and the past of the pa

the nation's only geothermal power plant. Although a rela-

tively inexpensive source of

tively inexpensive source of power, it presently supplies only about 4% of our outsomer's needs. Its most optimistic potential would supply only about 10%. Coal one day may be our sixth source of primary energy. We are in the process of acquiring reserves in Utah. Recent developments in solar power show interesting promise, but its use as a mayer source, at best, many years away. Tidal and vanid power are still in

never become practical for large-scale commercial use, but research continues. The demand for electricity continues to grow, partly because population itself communes to grow. In 1974 alone, about 100,000 more people were added to PC&E's service area. Dengy conservation elforts shore will not eliminate our need to build alhead today for your tomorrow.

for your tomorrow.
It's our job to keep you pro-

vided with adequate energy and reliable service at the hiwest possible cost. And for our part, we intend to divise thus. For your part, we hape you will entitle your efforts to conserve energy. It is not precious towards

# Management's Discussion and Analysis of the Summary of Operations

Pacific Gas and Electric Company / For the Five Years Ended December 31, 1976

### **OPERATING REVENUES**

Operating revenues have increased significantly in each year primarily because of increases in rates and sales volume. The following table sets forth the amounts by which the Company's electric and gas revenues during each of the last four years exceeded the revenues for the preceding year, together with the estimated increases and decreases attributable to these major factors.

	Millions				
	1976	1975	1974	1973	
ELECTRIC REVENUES:					
Rate Increases:					
Energy and Fuel Cost	\$ 52.3	\$ 94.0	\$153.6	\$50.3	
General	146.8	34.4	2.3	1.9	
Sales Volume and Other Changes	79.2	60.4	1.3	38.5	
Net Increase	\$278.3	\$188.8	\$157.2	\$90.7	
GAS REVENUES:		F-248-94-4			
Rate Increases:					
Cost of Gas Purchased	\$166.9	\$291.1	\$ 99.2	\$18.4	
General	49.7	13.4	1.7	38.7	
Sales Volume and Other Changes	(81.5)	13.3	(21.5)	(8.2)	
Net Increase	\$135.1	\$317.8	\$ 79.4	\$48.9	

### OPERATING EXPENSES

The major increase in operating expenses resulted from increases in the cost of electric energy and cost of gas sold.

From April 1973 until April 1976 the Company's electric rates were adjustable on a quarterly basis, subject to the approval of the California Public Utilities Commission (CPUC), to reflect changes in the costs and relative quantities of natural gas and fuel oil expected to be consumed in the Company's generating plants assuming, among other things, average weather conditions. The effect of this procedure was that actual weather conditions produced large variations in the Company's earnings. No change in rates under this procedure was authorized by the CPUC after January 1, 1975.

Increased purchase prices of gas sold have not materially affected Company earnings because the CPUC has, historically, authorized changes in gas rates to customers that track the cost of gas sold.

In accordance with the requirements of the CPUC, the Company has, since March 31, 1976, deferred in a balancing account the difference between cost of its electric energy and the energy cost collected from its customers. Subsequently, the Company has been required to maintain similar accounts to record under-collections and overcollections of gas cost increases. The deferred amounts are amortized as corresponding changes are made in customer rates. The balancing account for unbilled recoverable electric energy costs totaled \$251,681,000 at December 31, 1976. As a result of the drought-induced need to use greater quantities of fuel oil for electric generation and purchased power during the early part of 1977, the Company anticipates that this balancing account will peak at approximately \$350,000,000 by the end of April 1977. Pending receipt of revenues pursuant to CPUC-authorized customer rate adjustments, the Company intends to continue financing such fuel oil expenditures through internally generated funds and the issuance of short-term notes. Although such deferred costs are deducted currently on federal and state income tax returns, for financial statement purposes such costs are recognized in the computation of income tax accruals as the deferred costs are amortized. The effect of using these balancing accounts is that changes in costs of electric energy and gas no longer affect the Company's earnings since energy costs are included in operating expenses when they are offset by revenues.

Transmission and distribution expense increased 13% in 1976 over 1975 largely due to the increased price of natural gas used in the compressor stations.

Other operation expense increased 15% in 1976 and 17% in 1975 principally as a result of the general inflationary trend and the added expense of complying with ever-increasing requirements of environmental and other regulatory agencies.

Taxes on income were lower in 1976 and 1975 due primarily to increased statutory deductions available in determining taxable income. Many of the Company's tax deductions are related to its investment in utility plant; accordingly, as the investment in utility plant has increased, deductions have increased, even though operating income before income taxes has not increased proportionately. (See Note 3 of Notes to Financial Statements.)

### OTHER INCOME AND INCOME DEDUCTIONS

The amount of allowance for funds used during construction (ADC) has increased in recent years primarily due to the construction of Units 1 and 2 of the Company's Diablo Canyon nuclear generating plant. The portion of ADC recorded in 1976 which is estimated to be applicable to construction planned for completion in 1977, 1978 and 1979 is 89%, 2% and 2%, respectively. Substantially all of the ADC applicable to jobs planned for completion in 1977 represents ADC for the two nuclear units at Diablo Canyon. In connection with the August 24, 1976 interim decision on the Company's general rate increase, the CPUC stated that current ratemaking procedures are not well suited to the timely inclusion in rate base of significant additions to plant. Accordingly, the CPUC proposes to consider the addition of the Diablo Canyon nuclear generating plant in conjunction with an energy cost adjustment proceeding in order to grant timely rate treatment.

The gain on bonds purchased for the sinking fund declined in 1976 and 1975 as a result of purchasing bonds on the open market which were closer to maturity. The decline in 1976 was also due to a change in the accounting treatment of the gain on bonds purchased. (See Note 1 of Notes to Financial Statements.)

In addition, the prime reason other income increased over the last few years was because more interest expense has been applicable to property not included in rate base, thereby increasing the related income tax reduction. (See Note 3 of Notes to Financial Statements.)

### INTEREST EXPENSE AND PREFERRED DIVIDEND REQUIREMENTS

The increased interest expense and preferred dividend requirements over the years are a reflection of the issuance of more long-term debt and preferred stock at higher rates to finance the ongoing construction program.

### Lines of Business

Pacific Gas and Electric Company / For the Five Years Ended December 31, 1976

The approximate percentage of operating revenues and operating income, exclusive of taxes on income, attributable to each principal line of business was as follows:

	——— Operating Revenues———		Operating	Income ———
	Electric Gas		Electric	Gas
1972	63%	37%	83%	17%
1973	64%	36%	81%	19%
1974	64%	36%	90%	10%
1975	58%	42%	73%	27%
1976	59%	41%	71%	29%

### **Notes to Financial Statements**

Pacific Gas and Electric Company December 31, 1976 and 1975

### NOTE 1—SUMMARY OF SIGNIFICANT ACCOUNTING POLICIES:

The accounting records of the Company are maintained in accordance with the Uniform System of Accounts prescribed by the Federal Power Commission (FPC) and adopted by the California Public Utilities Commission (CPUC).

The cost of additions to utility plant and replacements of retirement units of property is capitalized. Cost includes labor, material and similar items and indirect charges for such items as engineering, supervision and transportation. An allowance for funds used during construction (ADC) is included in construction work in progress and credited to other income. A composite rate for this allowance (8% for 1976 and 1975), which assumes that funds used for construction were provided by debt and preferred and common equity, is applied to construction work in progress. This accounting practice results in the inclusion in construction work in progress of amounts considered by the CPUC as an appropriate cost of funds for purposes of establishing rates for utility charges to customers. Research and development costs related to specific construction projects and a portion of general engineering research costs are capitalized. Other research and development costs are charged to expense as incurred. Costs of repairing major units of property and replacement of minor items of property are included in the Statement of Income as maintenance. Costs of depreciable units of plant retired are eliminated from utility plant accounts and such costs plus removal expenses and less salvage are charged to accumulated depreciation. Materials and supplies, fuel oil, and gas stored underground are stated at average cost. Revenues from residential and commercial customers are recorded as meters are read on a cycle basis throughout each month.

In accordance with the requirements of the CPUC, the Company has, since March 31, 1976, deferred in a balancing account the difference between cost of its electric energy and the energy cost collected from its customers. Subsequently, the Company has been required to maintain balancing accounts to record under-collections and overcollections of gas cost increases. The deferred amounts are amortized as corresponding changes are made in customer rates. Although such deferred costs are deducted currently on federal and state income tax returns, for financial statement purposes such costs are recognized in the computation of income tax accruals as the deferred costs are amortized. The effect of using these balancing accounts is that changes in costs of electric energy and gas no longer affect the Company's earnings since energy costs are included in operating expenses when they are offset by revenues.

For financial statement purposes, depreciation of utility plant is computed on a straight-line remaining life basis at rates based on the estimated useful lives of properties. The annual provisions for depreciation, expressed as a percentage of the average balances of depreciable plant, were 3.1% for 1976 and 3.0% for 1975. For federal income tax purposes, depreciation is generally computed using the most liberalized methods allowed by the Internal Revenue Code. The CPUC requires that the Company include in net income the current tax differences arising from certain timing differences in connection with depreciation, ADC and other overhead costs of construction, gain on bonds purchased for sinking fund, and investment tax credit. Investment tax credits are applied as a reduction of federal income tax expense through the use of a five-year moving average method. Such tax differences are reflected in customer rates authorized by the CPUC.

Bond issuance premium or discount and related expenses are being amortized over the lives of the issues to which they pertain. Prior to September 1976 gain on reacquisition of bonds to satisfy sinking fund requirements was credited to other income in the year of acquisition, thereby conforming to the requirements of the Financial Accounting Standards Board and the ratemaking of the CPUC. Beginning in September 1976 the CPUC changed its method of recognizing such gain or loss for ratemaking purposes. The new method requires amortization of gain or loss over the remaining life of the reacquired issues. In accordance with the requirements of the FPC the Company on that date adopted the same method of accounting for book purposes. The federal income tax on such gain is recognized over the average life of remaining property.

Retirement plan costs are accrued in accordance with an actuarial cost method (individual entry age normal method). At December 31, 1976, the value of retirement plan assets exceeded the estimated vested benefits of the plan.

Investments in subsidiaries are stated in accordance with the equity method. The assets, revenues, and earnings of the subsidiaries are not significant in relation to those of the Company. Approximately 64% and 60% of the cost of the Company's natural gas purchased in the years 1976 and 1975 were from Pacific Gas Transmission Company, a 53% owned subsidiary. The price paid is regulated by the FPC.

Earnings per common share were computed by dividing earnings available for common stock by the weighted average number of common shares outstanding. The weighted average number of common shares outstanding is computed by dividing the aggregate of the number of common shares outstanding at the beginning of each month during each year by twelve.

### NOTE 2—MORTGAGE BONDS:

The First and Refunding Mortgage Bonds are issued in series, bear annual interest from 2%% to 9.85% and mature from December 1, 1977 to September 1, 2008. Subject to indenture provisions as to earnings coverages and bondable property available for security, additional bonds may be issued up to an outstanding aggregate amount of \$5,000,000,000. The Board of Directors may from time to time increase the amount authorized. All real properties and substantially all personal properties are subject to the lien of the mortgage. Securities representing investments in subsidiaries are pledged as collateral for the bonds.

The Company is required, according to provisions of the First and Refunding Mortgage, to make semiannual sinking fund payments on February 1 and August 1 of each year for the retirement of the bonds of any series equal to  $\frac{1}{2}$  of  $\frac{1}{8}$  of the aggregate bonded indebtedness outstanding on the preceding November 30 and May 31, respectively. Bonds of any series may be used to satisfy this requirement.

Sinking fund requirements due in 1977 for bonds outstanding at December 31, 1976 amount to \$32,170,000. This amount, less treasury bonds of \$24,412,000 plus Series N Bonds of \$47,156,000 maturing on December 1, 1977, is included in current liabilities.

### NOTE 3 — TAXES ON INCOME:

Taxes on income generally reflect amounts currently payable or refundable with two exceptions. Investment tax credits are used to reduce federal income taxes through the use of a five-year moving average, and energy costs are recognized in recorded income tax expense when the energy costs are included in bills to customers (see Note 1). Approximately \$276,000,000 of unbilled recoverable energy costs are deductible in the 1976 federal income tax return because federal and state income tax regulations require that energy costs be deducted on tax returns in the years such costs are incurred. Therefore, the Company expects a federal income tax refund of approximately \$75,000,000 for the year 1976 which represents the amount of prior years taxes available for such refund. In addition, the Company will have available tax credits of approximately \$58,000,000 to reduce federal income tax payments for years after 1976.

A reconciliation between the amount of reported income tax expense and the amount computed by multiplying the income before taxes by the statutory federal income tax rate for the years 1976 and 1975 is as follows:

	1976		1975	
	Amount (Thousands)	Percent of Pretax Income	Amount (Thousands)	Percent of Pretax Income
Computed provision	\$143,772	48.0 %	\$118,902	48.0 %
Adjustments multiplied by the statutory federal income tax rates—increase (decrease):				
Tax depreciation in excess of book depreciation	(22,281)	(7.4)	(29,081)	(11.8)
Allowance for funds used during construction	(37,998)	(12.7)	(33,768)	(13.6)
Other overhead construction costs	(12,623)	(4.2)	(11,190)	(4.5)
Repair allowance	(18,720)	(6.3)	(4,320)	(1.8)

### NOTE 4—COMPENSATING BALANCES AND SHORT-TERM BORROWING ARRANGEMENTS:

Lines of credit for loans at prevailing prime interest rates were maintained with sixteen banks at December 31, 1976. The unused portion was \$349,870,000 at December 31, 1976.

The Company follows the customary industry practice of maintaining average cash balances which compensate the banks for the available lines of credit, usage of the lines, and other banking services. The cash balances maintained at the banks are not legally restricted.

As of December 31, 1976 and December 31, 1975, there were \$265,995,000 and \$117,150,000 of the Company's commercial paper outstanding at average interest rates of 4.8% and 5.6%, respectively. The maximum amounts of aggregate short-term borrowings outstanding at any month end during the years 1976 and 1975 were \$354,670,000 and \$140,550,000, respectively. During the years 1976 and 1975, the approximate weighted average interest rates for short-term borrowings were 5.3% and 6.1%, respectively, and the approximate average short-term borrowings outstanding were \$227,587,000 and \$71,800,000, respectively. These weighted average interest rates were computed on a daily basis weighted for the amounts borrowed at each rate.

The usual terms of short-term borrowings are 90 days for bank loans and 10 to 90 days for commercial paper.

### **NOTE 5—COMMITMENTS AND OTHER MATTERS:**

Capital expenditures for the year 1977 are estimated at \$640,000,000.

Total research and development costs incurred during the years 1976 and 1975 were approximately \$31,000,000 and \$25,000,000, of which \$21,000,000 and \$16,000,000 were capitalized as part of the cost of construction projects.

The Company provides retirement and savings fund plans for substantially all employees. The costs of these plans, charged to expense and utility plant, were \$51,438,000 and \$45,423,000 for the years 1976 and 1975.

The Company has executed a guarantee, with all necessary approvals of the CPUC, of Canadian bank loans to a wholly-owned subsidiary, Alberta and Southern Gas Co., Ltd. (A & S). At December 31, 1976, these loans approximated \$77,000,000 and may be increased to \$100,000,000 under agreements with the banks. Interest on these loans has been allowed as one of the costs of service deductible from the Canadian-regulated price of gas purchased by A & S, but Alberta authorities administering the gas pricing laws have objected to future inclusion of the interest on a substantial portion of these loans. A & S, whose principal function is the acquiring of natural gas in Canada and providing for its transportation to the United States border, lends funds to oil and gas companies for the exploration and development of natural gas reserves in Canada and makes advances based on proven reserves. At December 31, 1976, approximately \$70,000,000 was loaned to Canadian subsidiaries of large oil and gas companies and is subject to repayment without regard to the success of the exploration and development efforts. The balance of approximately \$7,000,000 has been advanced against proven reserves and is refundable out of production.

Operating revenues, operating income, net income and earnings per common share for the four quarters of 1976 are shown in the table below. Due to the seasonal nature of the utility business, the annual amounts are not generated evenly by quarter during the year.

	(Unaudited)Quarter Ended					
	December 31, 1976	September 30, June 30, 1976 1976		March 31, 1976		
Operating revenues	\$704,093,000	\$642,351,000	\$618,280,000	\$682,004,000		
Operating income	\$110,371,000	\$109,691,000	\$106,445,000	\$ 77,363,000		
Net income	\$ 87,793,000	\$ 82,608,000	\$ 80,230,000	\$ 51,353,000		
Earnings per common share	\$.81	\$.82	\$.80	\$.47		

### **NOTE 7—REPLACEMENT COST:**

The Securities and Exchange Commission (SEC) requires that the Company disclose in financial statements filed with the SEC the estimated current "replacement cost" of certain of its assets, accumulated replacement cost depreciation applicable to those assets, and the amount of depreciation based on "replacement cost". There is considerable controversy over the usefulness of such information in assessing the current economics of the Company in an inflationary economy. The Company believes that the calculations necessary to provide the estimated "replacement cost" as required by the SEC are not appropriate in determining the impact of inflation on regulated utilities such as the Company. The Company's operations, including substantially all of its revenues, are subject to regulation by the CPUC. It is the practice of the CPUC to authorize rates at a level to allow the Company to recover its actual investment in facilities used in providing utility service. Therefore, when facilities are replaced at costs higher than the cost of existing facilities, rates can be changed to cover any changes in depreciation and other costs including the return on any additional investment required. The impact on earnings can reasonably be expected, therefore, to be zero.

The SEC requires that this annual report refer to the replacement cost information contained in the Company's 10-K report for 1976. A copy of that report may be obtained upon written request to the Corporate Secretary.

# **Accountants' Opinion**

The Stockholders and the Board of Directors of Pacific Gas and Electric Company:

HASKINS & SELLS

We have examined the balance sheet of Pacific Gas and Electric Company as of December 31, 1976 and 1975 and the related statements of income, stockholders' equity, and changes in financial position for each of the years then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances.

In our opinion, the above-mentioned financial statements present fairly the financial position of the Company at December 31, 1976 and 1975 and the results of its operations and the changes in its financial position for each of the years then ended, in conformity with generally accepted accounting principles applied on a consistent basis.

PG&E's service territory covers more than 94,000 square miles in Northern and Central California with a population of more than 8 million. As shown on the lower map, the San Francisco Bay Area is centrally located in the Company's extensive service area.

PG&E has developed far-flung sources of natural gas and electric energy. As indicated on the upper map, natural gas pipelines reach 1,400 miles northward into Canada and almost an equal distance southeasterly to the Permian Basin of Texas and New Mexico. In addition, PG&E's electric generating system is augmented by major interconnections with other sources. The Pacific Intertie links the hydroelectric plants of the Columbia River Basin with the thermal generating resources in Northern and Southern California.
