

P. G. and E. Progress

Super Inch Daily Capacity 700,000,000 Cubic Feet

With the completion of new parallel lines, the capacity of P. G. and E.'s Super Inch natural gas transmission line has been almost tripled since its first use in 1950. When the line began transporting gas to northern and central California from fields in Texas and New Mexico, it had a capacity of 250,000,000 cubic feet per day.

The capacity is now 700,000,000 cubic feet per day as the result of adding 284 miles of loops, or parallel sections, to the original 502 miles of pipeline. The project represents an investment by P. G. and E. of \$98,000,000.
